

Additional File 3

Additional File 3. Ivag CpG after E7LP or C+P +E7LP vaccination increased E7-specific IFN- γ secreting cells in Cervix-Vagina (CV). Groups of naive mice received the treatments indicated below the graph. C+P chemotherapy was administered 4/5 days before vaccination. 3 doses of ivag CpG were administered 5, 8 and 12 days after vaccination. CV were analyzed by IFN- γ ELISPOT 15 days after vaccination. Mean and individual E7-specific IFN- γ secreting T cells are shown. *= $p < 0,05$ by Student t-test.
