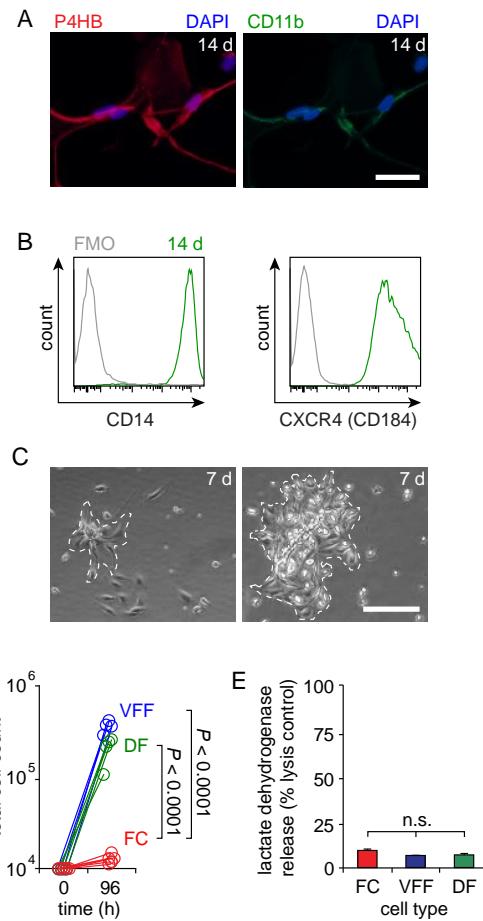

Fig. S1. Additional characterization of human FC differentiation *in vitro*. (A) P4HB and CD11b immunostaining patterns at 14 d. Scale bar, 50 μ m. (B) CD14 and CXCR4 (CD184) expression at 14 d. FMO controls are shown in gray. (C) Phase-contrast images of FC colonies at 7 d. The left image shows a typically sized 10~20 cell colony; the right image shows a rarely observed ~100 cell colony. White dashed lines indicate the boundary of each colony. Scale bar, 100 μ m. (D) Cell count data showing FC proliferation over 96 h, compared to DF and VFF. P values were calculated using ANOVA ($n = 4$ -6 per condition). (E) Lactate dehydrogenase release by FCs, DFs, and VFFs. Data are shown as mean \pm s.e.m. Statistical testing was performed using ANOVA ($n = 4$ per condition).

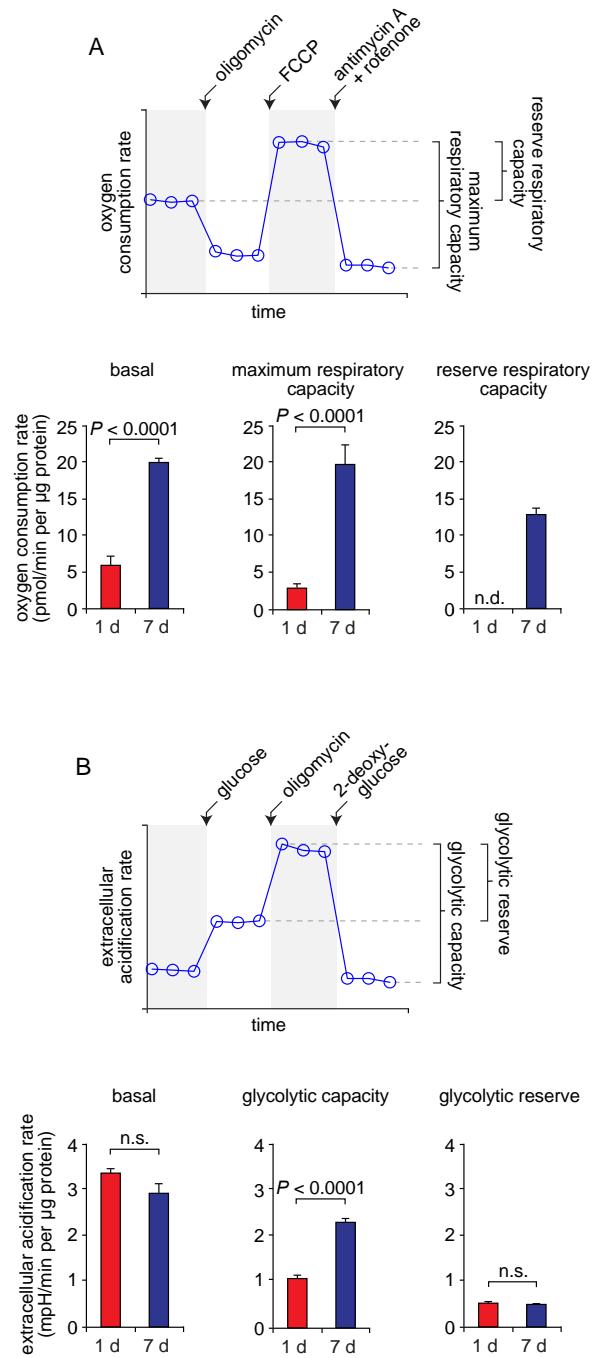

Fig. S2. Bioenergetic profiles of human FCs at 1 and 7 days. (A) Analysis of mitochondrial respiration. The time-course schematic illustrates the calculation of maximum and reserve respiratory capacities from changes in real-time oxygen consumption rate. Data in the bar graphs (derived from the real-time plots in Fig. 2H) are shown as mean \pm s.e.m. P values were calculated using a Student's t test ($n = 10$ per condition). (B) Analysis of glycolysis. The time-course schematic illustrates the calculation of glycolytic capacity and reserve from changes in real-time extracellular acidification rate. Data in the bar graphs (derived from the real-time plots in Fig. 2I) are shown as mean \pm s.e.m. P values were calculated using a Student's t test ($n = 4$ per condition).

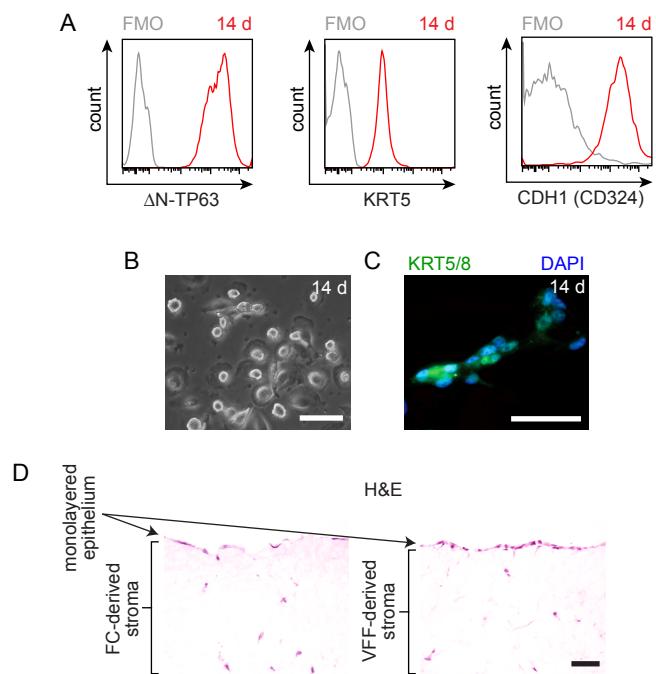

Fig. S3. Characterization of monocytes following epithelial cell-oriented culture. (A) Δ N-TP63, KRT5, and CDH1 (CD324) expression at 14 d. FMO controls are shown in gray. (B) Phase-contrast image showing cell morphology at 14 d. Scale bar, 50 μ m. (C) KRT5/8 immunostaining pattern in a cellular chain at 14 d. Scale bar, 50 μ m. (D) H&E-stained sections showing morphology of engineered tissues generated using monocyte-derived epithelial cells and either FCs or VFFs as the stromal cell source. Scale bar, 50 μ m.

Table S1. Reactome pathways enriched in protein sets associated with FC differentiation. Pathways were identified using the Enrichr algorithm based on a Benjamini Hochberg-adjusted P value < 0.01 and minimum of 4 protein identifications per pathway. Pathways are listed in order of ascending adjusted P value; significant pathways associated with the initial 7 d differentiation period are also presented in Fig. 2G.

Table S4. Cytokine production by FCs and VFFs, cultured under basal conditions for 24 hours. Raw concentrations (pg/mL) are shown as a single value per cytokine, assayed using pooled culture supernatant ($n = 6$ per condition) and a multiplexed protein array. Serum-free medium was used as a negative control. Log₂-transformed fold change data (FC versus VFF) are presented in Fig. 5C.
