

Figure S1. Purification of the recombinant β -tubulin protein. The evaluation of the purification process was obtained after performing a 10% SDS-PAGE gel. In (A), a molecular weight marker with some bands is shown. In (B) and (C), 10 μ g of total bacterial cultures non-expressing and expressing the recombinant protein (presenting about 49.8 kDa), respectively, and in (D), the recombinant protein (10 μ g) purified by affinity chromatography are also shown.
