Table S2: Effects of maximal depth and maximal area of lung consolidation at first BP diagnosis on risk of BP relapse. Only cattle for which both thoracic sides were examined by TUS were included (n = 101).

Independent variable and level	Odds ratio*	95% Confidence Interval	*P*-value
Maximal depth (per cm)	1.38	1.05-1.81	.02
Maximal area (per cm^2)	1.06	1.02-1.12	.01

* Results from two multivariable models (one for maximal depth and one for maximal area) including feedlot effect as a random effect.
