EC 1.1.1.28 is D-lactate dehydrogenase, the enzyme catalyzing the conversion between D-lactate and pyruvate. For *Lactobacillus plantarum* SK002, it has been shown that this enzyme also can also convert phenylpyruvate to D-phenyllactate. The BRENDA database [46] also lists this activity for *L. pentosus* and *L. jensenii*, in addition to *Pediococcus acidilactici* and *P. pentosaceus*. From the current literature it is uncertain whether all D-lactate dehydrogenases have a similar potential to also produce phenyllactate or whether this is a specific trait of certain Lactobacillaceae enzymes. UniProtKB, on the other hand, lists 1,809 entries with the EC 1.1.1.28 annotation. These comprise 1,443 unique sequences (UniRef100). In addition to the annotated genes, UniProtKB lists 481 proteins with identical sequences, which are not annotated as such. These total of 2,290 proteins are found in 1,643 different organisms, including mostly bacteria, 13 archaea and 15 eukaryotic organisms, such as fungi, amoebozoia, and diatoms. Metagenomic data from 1,885 human stool samples from the curated Metagenomic Dataset (<https://github.com/waldronlab/curatedMetagenomicData> [47] were searched for the 1,443 (EC 1.1.1.28)-related UniRef100 entries. 92 of the UniProt entries for EC 1.1.1.28 were found in at least one human microbiome data set. These 92 unique sequences represent 271 different UniProtKB proteins that are found in different strains of 107 bacterial species and insufficiently described bacteria.
