Supplementary Table I. Distribution of the PERFORM study population by country and region

Supplementary Table II. Medication use before and at randomization among patients from non-Asian and Asian countries

Supplementary Table III. Blood pressure and lipid levels at 3, 12, and 24 months among patients from non-Asian and Asian countries

Supplementary Table IV. Two-year primary, secondary, and tertiary outcomes in patients receiving aspirin from non-Asian and Asian countries

Supplementary Table V. Two-year primary, secondary, and tertiary outcomes in patients of non-Asian and Asian ethnic origins

Supplementary Table VI. Baseline characteristics associated with 2-year major adverse cardiovascular events and the interaction between patients from Asian and non-Asian countries

Supplementary Methods

Ischemic strokes were classified into six etiologic subtypes: atherothrombotic, likely atherothrombotic, lacunar, cardioembolic, coexisting (atherothrombotic and lacunar), or unknown.¹

Atherogenic dyslipidemia was defined as high-density lipoprotein cholesterol ≤ 40 mg/dL and triglycerides ≥ 150 mg/dL.² Metabolic syndrome was defined, using World Health Organization and National Cholesterol Education Program Adult Treatment Panel III criteria,³⁻⁵ as ≥ 3 of: body mass index >30.0 kg/m² for non-Asians or >27.5 kg/m² for Asians,⁶ fasting blood glucose 5.6–6.9 mmol/L (100–125 mg/dL), systolic blood pressure (BP) >130 mm Hg, triglycerides >1.7 mmol/L (150 mg/dL), and high-density lipoprotein cholesterol <1.0 mmol/L (40 mg/dL) for men or <1.3 mmol/L (50 mg/dL) for women.
