

Supplementary information for

Functional phenotypic diversity of regulatory T cells remaining in inflamed skin

Ryoyo Ikebuchi, Maika Fujimoto, Yasutaka Nakanishi, Hiromi Okuyama, Taiki Moriya, Yutaka Kusumoto, Michio Tomura

Figure S1. Gene expression profiles for all genes examined

Figure S2. Cross-correlation analysis using FCM data with two sets of multicolor panels

Figure S3. tSNE analysis of skin and dLN Tregs with different migration activity

Figure S4. tSNE analysis of Tregs migrating to and remaining in skin

Figure S5. Clustering analyses of skin Tregs

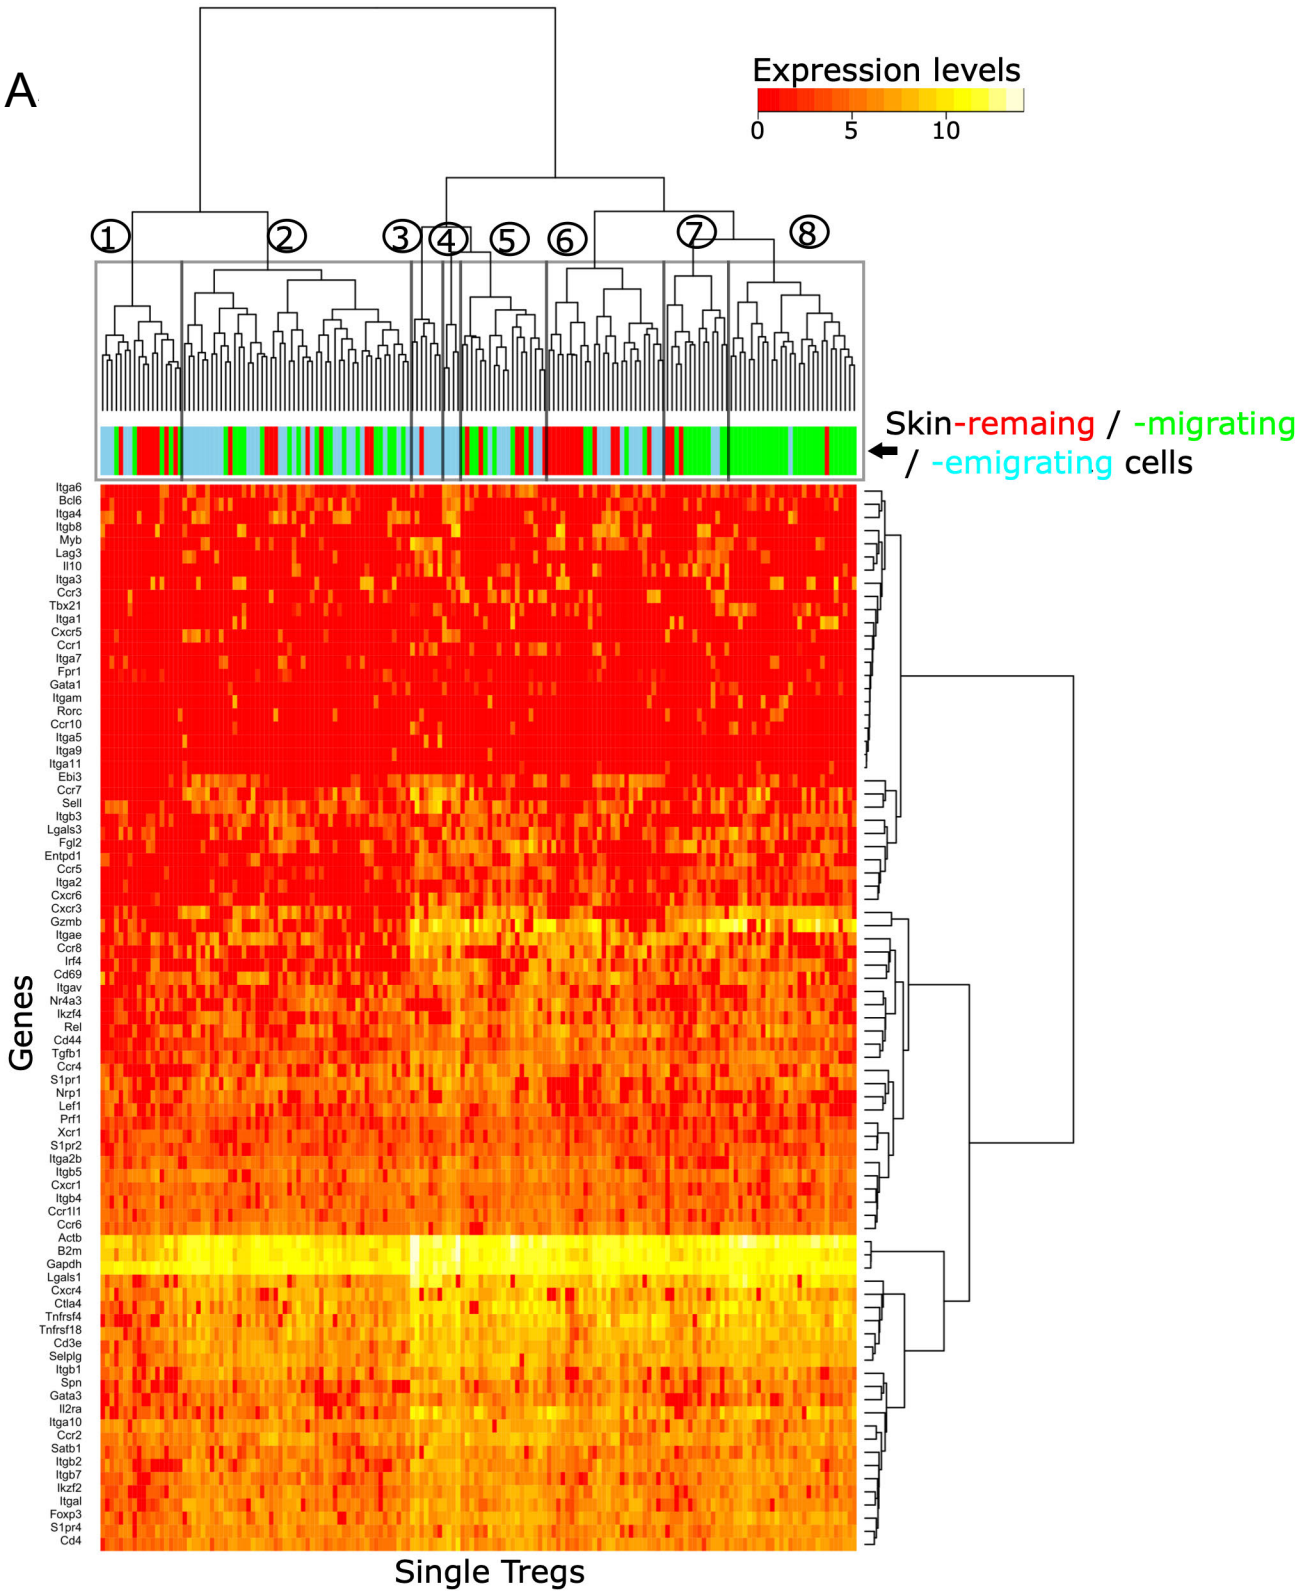

Figure S6. tSNE analysis using expression profiles of CCR5, CD103, Nrp1, CD39, and CD25 in skin Tregs

Table S1. Sequences of antibodies using for sorting and flow cytometer

Table S2. Sequences of primers using for pre-amplification and sqPCR

Table S3. Cell numbers of Tregs with different migration status in clusters generated by manual gating

A

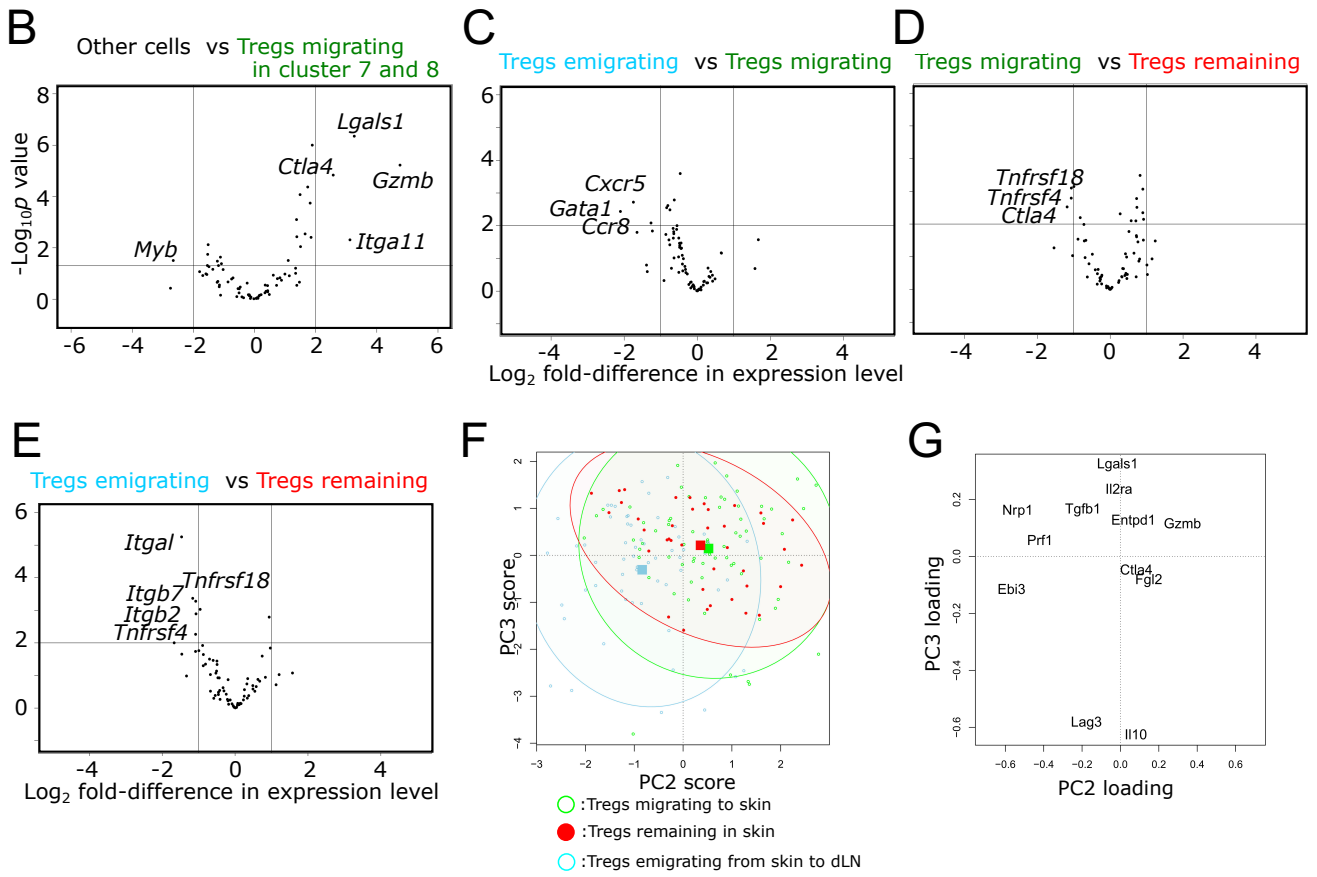

Figure S1. Gene expression profiles for all genes examined

(A) Heatmap showing all single-cell expression data. Migration activities of cells are depicted as follows: Tregs migrating to skin (green), Tregs remaining in skin (red), Tregs emigrating from skin to dLN (cyan). Numbers in a tree diagram of single cells indicate cluster numbers. Clustering was performed by the Manhattan distance and Ward's method. (B, C, D, and E) Volcano plots indicating genes differentially expressed in Tregs migrating to skin in clusters 7 and 8 and between each of the three Treg populations. Vertical lines indicate a two-fold change in expression. Horizontal lines indicate $p = 0.01$. Selected genes showing statistically significant differences in expression among populations labeled. (F) PC projections of individual Tregs within the three migratory populations. PC2 and PC3 are shown (accounting for 26.5% and 12.5% of the total variation, respectively). The confidence ellipses help to visually compare relationships among the populations. Squares indicate the mean value for each subset with the same color. (G) PC projection of 12 genes, showing contributions to PC2 and PC3.

A

Fluorochrome	Molecule
PE-Cy7	CD39
Alexa Fluor 647	GzmB
PE-Dazzle594	CTLA-4
BV711	CD25
BV421	Nrp1

B

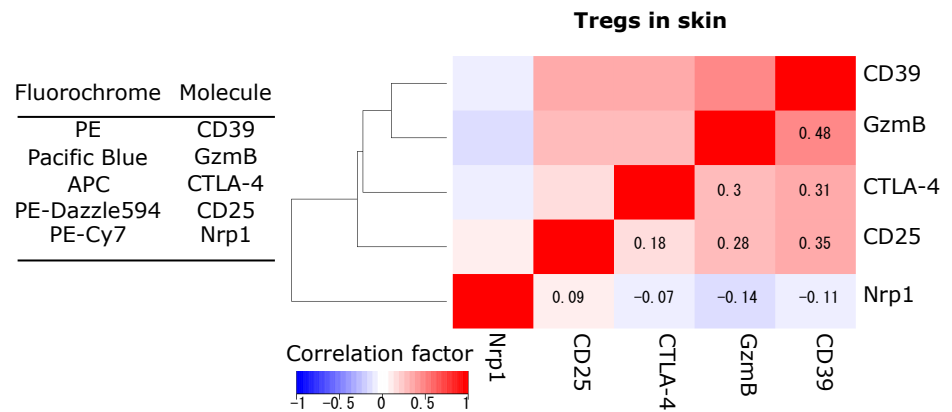

Figure S2. Cross-correlation analysis using FCM data with two sets of multicolor panels

(A) FCM multicolor panel used in Fig. 2B and C. (B) Cross-correlation analysis of the expression profiles of five proteins using pooled FCM data with a different color panel from (A) ($n = 3$). Clustering was performed by the Manhattan distance and the group average method.

For molecule expression:

○:Negative ○:Very low ○:Low ○:Mid ○:High ○:Very high

For migration status:

○:Tregs migrating to skin ○:Tregs remaining in skin ○:Tregs emigrating from skin to dLN ○:Tregs remaining in dLN or migrating from other tissues to dLN

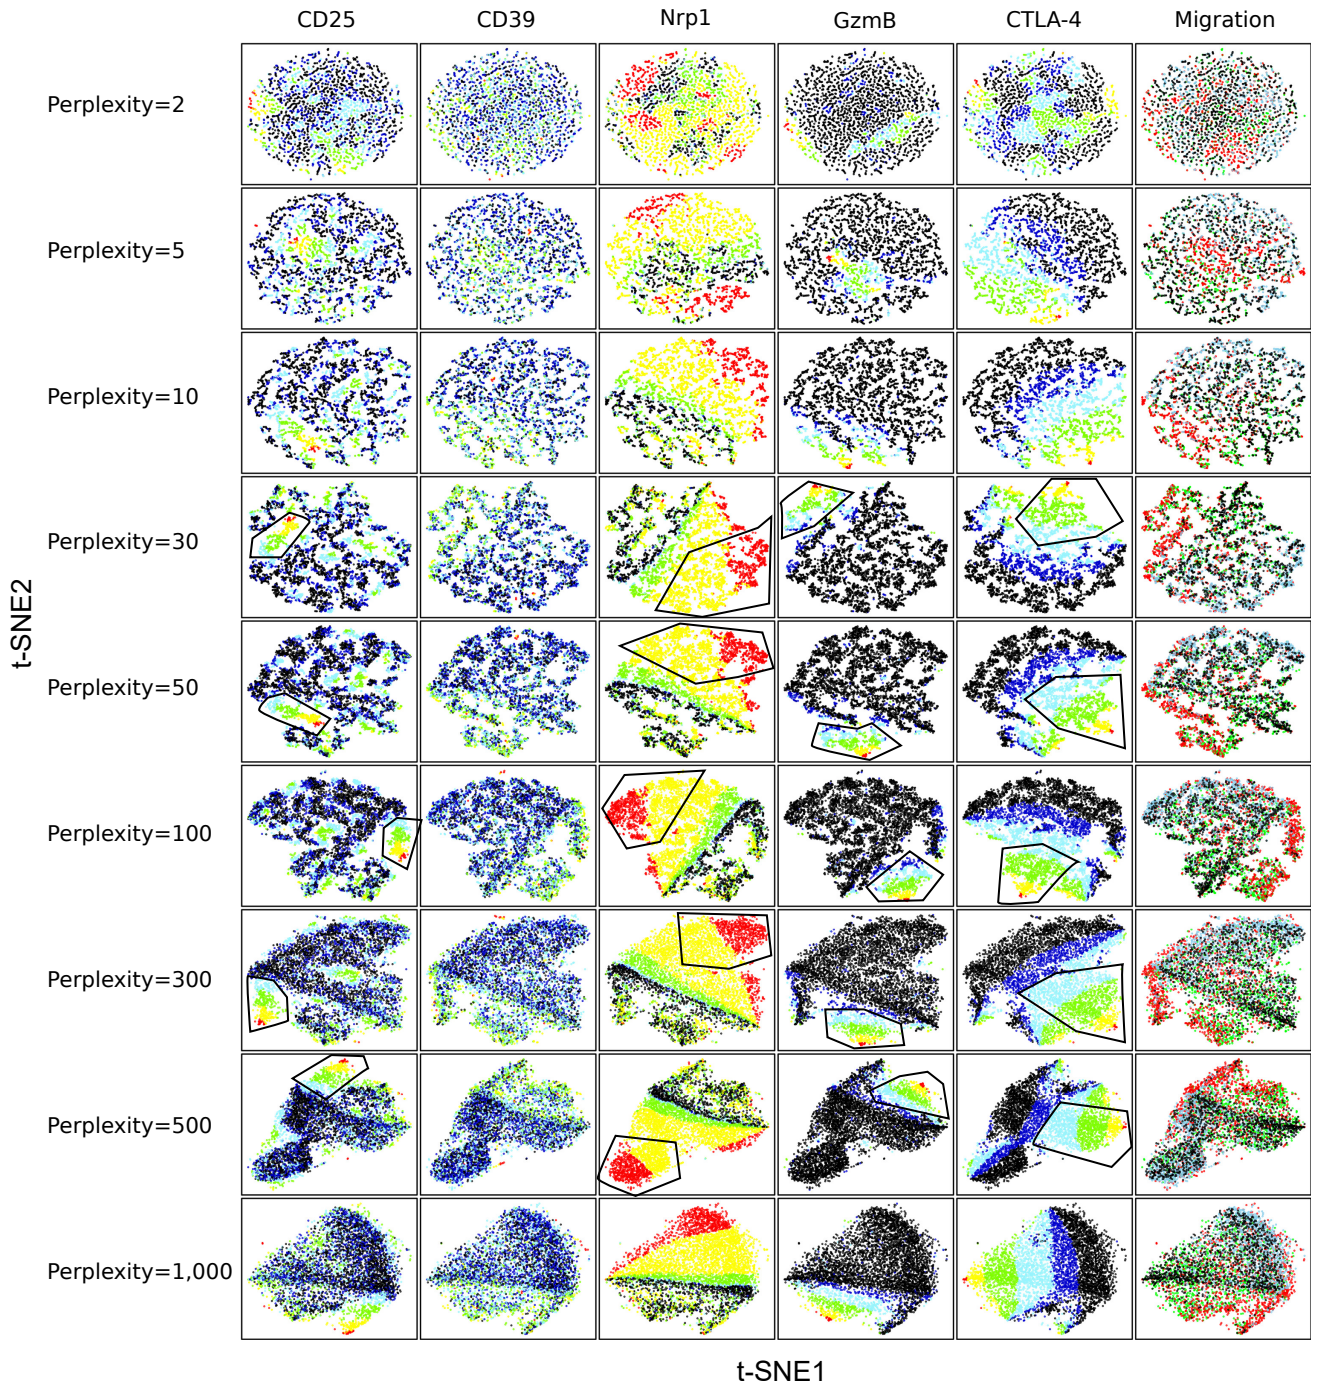

Figure S3. tSNE analysis of skin and dLN Tregs with different migration activity
tSNE projections of different perplexities using same data of Fig. 3. Six expression levels (defined as in Fig. 3A) are indicated by different colors. Clusters named CL-25, CL-Nr, CL-Gz, and CL-CT were indicated in tSNE plots showing expression of CD25, Nrp1, GzmB, and CTLA-4 (polygons). Migration activities of individual cells are indicated in the tSNE plots to the extreme right (migration) by different colors.

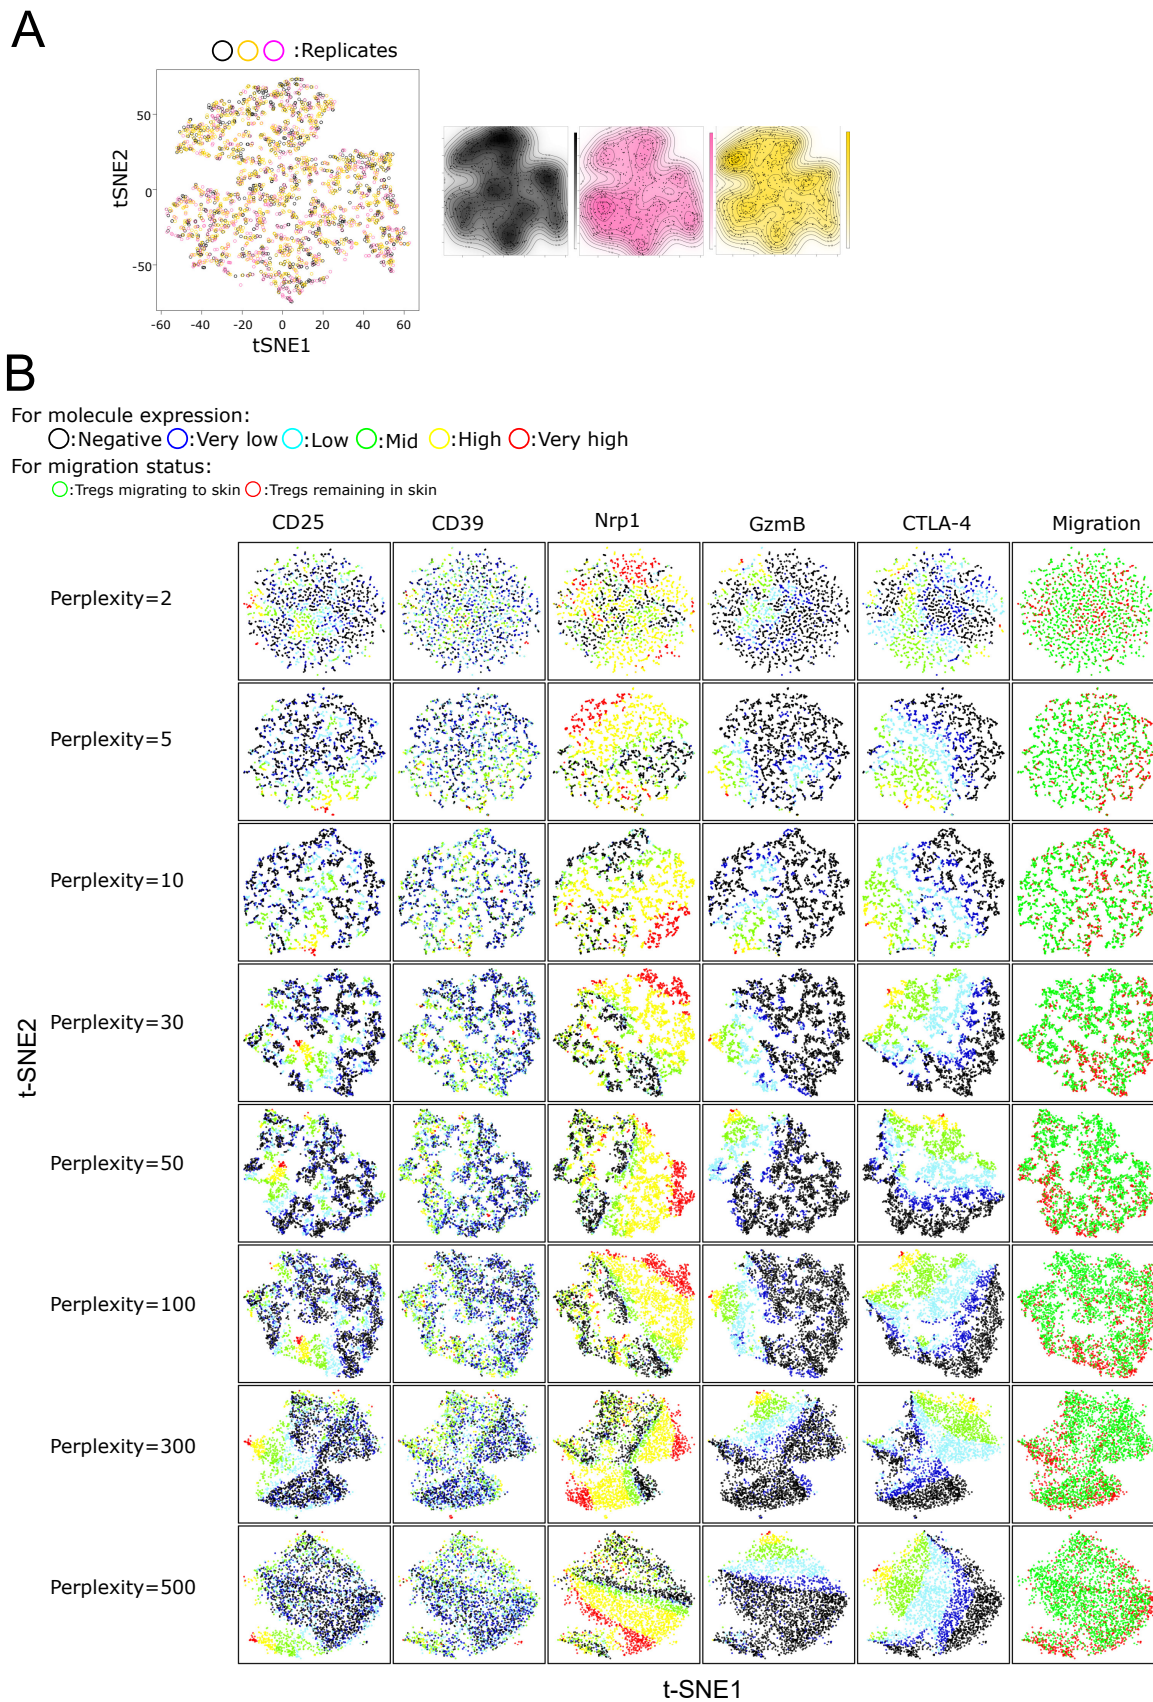

Figure S4. tSNE analysis of Tregs migrating to and remaining in skin

(A) tSNE projection of skin Tregs. Cells in each triplicate datasets are indicated by a different color. (B) tSNE projections of different perplexities using same data of Fig. 4. Expression levels and migration activity of individual cells are indicated as in Fig. S3.

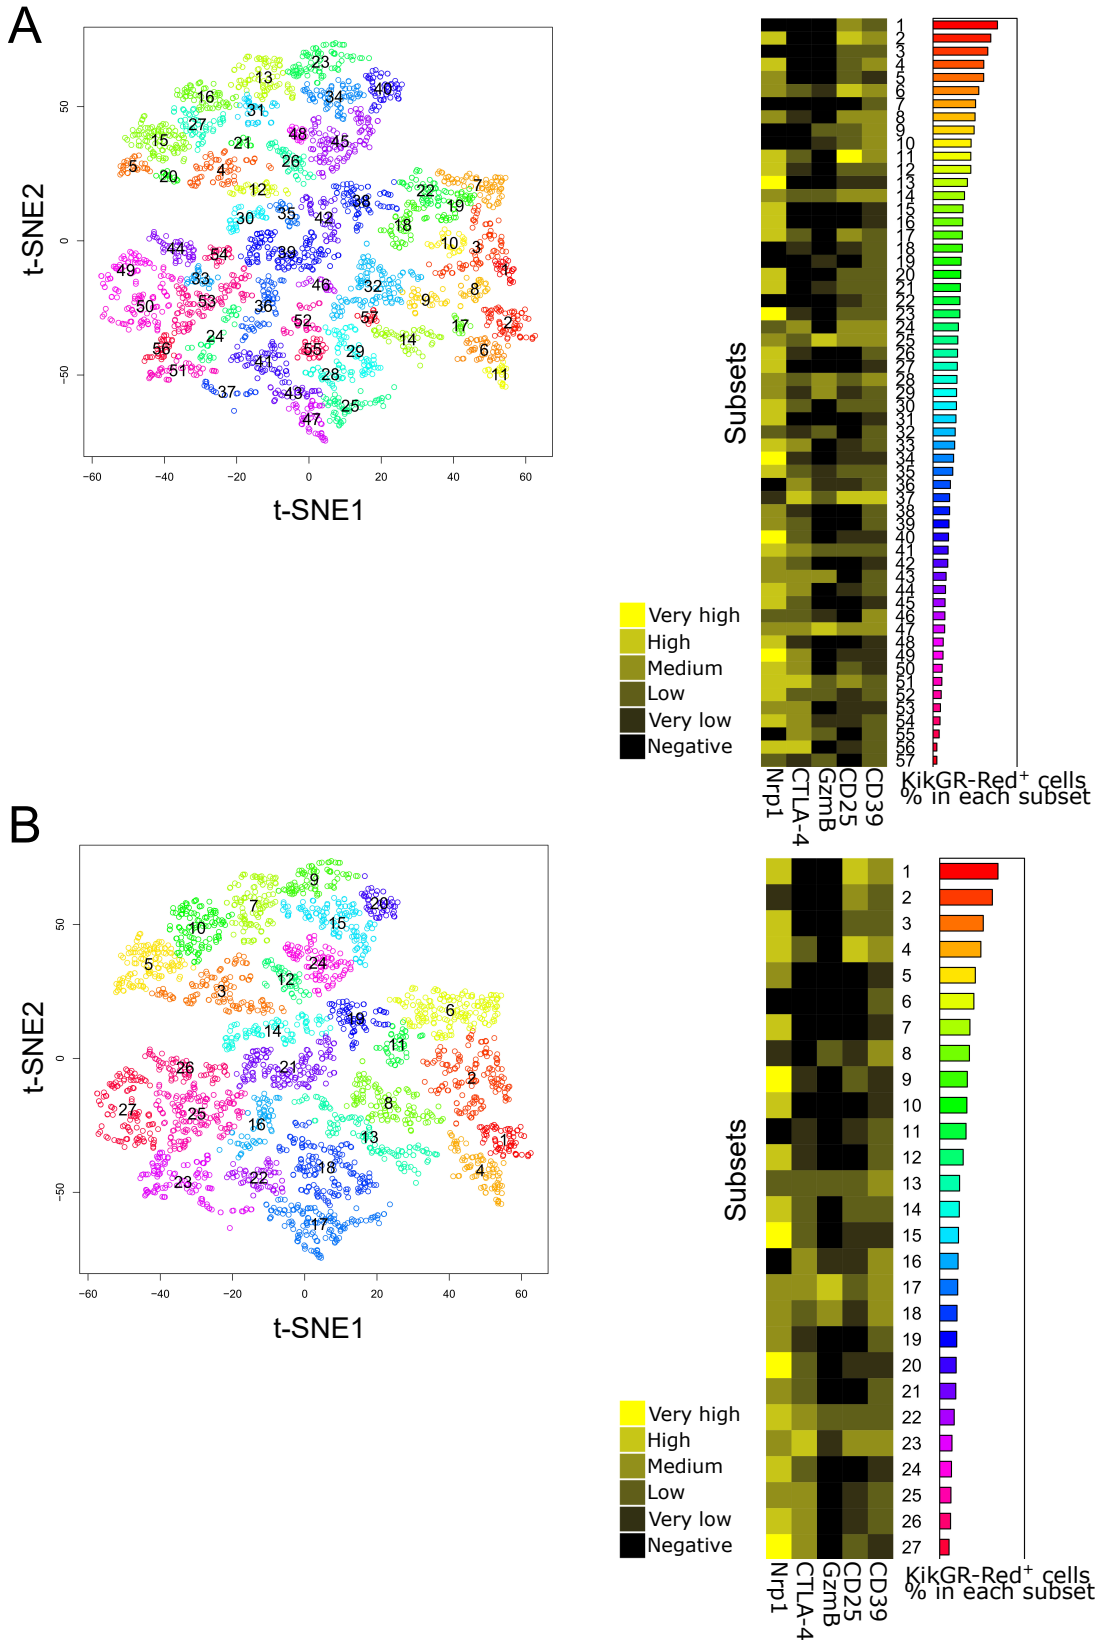

Figure S5. Clustering analyses of skin Tregs

(A, B) Mean expression of the five molecules in each of 57 and 27 subsets identified by Phenograph using data of tSNEV1 and V2 (k=12 and 30).

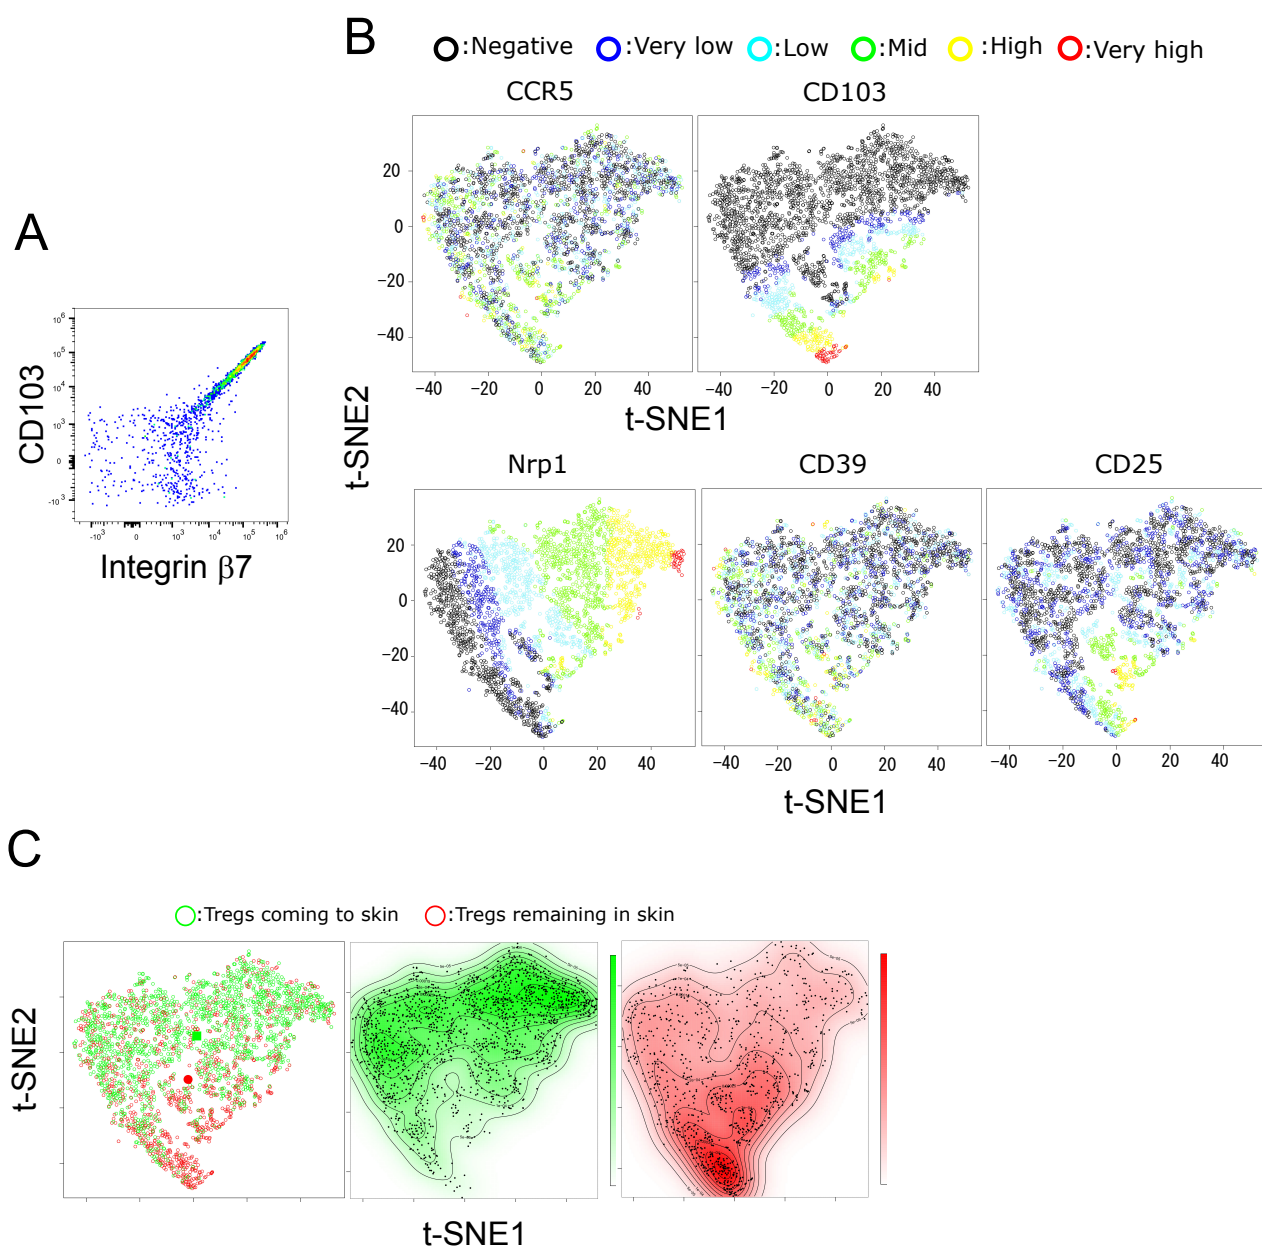

Figure S6. tSNE analysis using expression profiles of CCR5, CD103, Nrp1, CD39, and CD25 in skin Tregs

(A) Representative data of CD103 (Integrin α E) and Integrin β 7 expression in skin Tregs ($n = 2$). (B, C) tSNE projections of seven proteins expressed by Tregs from pooled data of individual Tregs migrating to and remaining in skin ($n = 3$). Six expression levels (defined as in Fig. 3A) and the migration activity of individual cells are indicated by different colors. Clusters were defined by manual gating (polygon).
