

Table S3. Risk of mortality on dialysis associated with HCV serostatus in multivariable Cox regression, with adjustment for FIB 4 index as an assessment of liver disease severity (N=174,387)

	HR	95% CI	P value
HCV-seronegative	Ref	-	-
HCV-seropositive	1.09	1.06-1.13	<0.001
FIB-4 Index			
Low	Ref	-	-
Intermediate	1.20	1.18-1.23	<0.001
High	1.88	1.84-1.93	<0.001

Model also adjusted for age, race, gender, pre-observation dialysis time, dialysis modality, primary insurance payer, median neighborhood income category, comorbidities of cardiovascular disease and diabetes and COPD, albumin categories, hemoglobin categories.

(Note: platelets and liver disease covariates are not in model, because platelets are in FIB-4 formula and FIB-4 is intended to categorize liver disease severity)
