

## SUPPLEMENTARY INFORMATION

### An accurate prediction model to identify undiagnosed at-risk patients with COPD: a cross-sectional case-finding study

**Supplementary Figure 1** Study flow in the development (a) and validation (b) cohorts. An abnormal CXR includes overt bronchiectasis (n= 11 and 4), interstitial lung disease (n= 8 and 3), pleural effusion (n= 6 and 2), lobar infiltration (n= 4 and 2), lung mass (n= 3 and 1), or mediastinal lesions (n= 2 and 0) in the development and validation cohorts, respectively. *CXR* chest X-ray, *CAT* COPD assessment test, *COPD* chronic obstructive pulmonary disease

**Supplementary Figure 2** Sensitivity analysis for the influence of dropping different variables from the prediction model ( $P_{COPD}$ ) on the diagnostic accuracy of COPD represented by the area under the receiver operating characteristic curve (AUROC) in the development cohort.  $P_{COPD}$  probability of COPD, CI conference interval

**Supplementary Figure 3** Sample size estimation for the validation cohort. Given a type I error of 0.05, a type II error of 0.1 (equal to a power of 0.9), the null hypothesis value of 0.5, the ratio of subjects with versus without COPD of 3, the required minimal sample size is at least 116 (calculated using the MedCalc software).

Sample size: area under ROC curve

Type I and II error

Type I error (Alpha, Significance):	0.05
Type II error (Beta, 1-Power):	0.10

Input

Area under ROC curve:	0.7
Null Hypothesis value:	0.5
Ratio of sample sizes in negative / positive groups:	3

Results

Number of positive cases required:	29
Number of negative cases required:	87
Total sample size (both groups together):	116

		Type I Error - Alpha			
		0.20	0.10	0.05	0.01
Type II Error	0.20	13 + 39	17 + 51	22 + 66	32 + 96
	0.10	18 + 54	23 + 69	<b>29 + 87</b>	41 + 123
	0.05	23 + 69	29 + 87	35 + 105	48 + 144
	0.01	35 + 105	42 + 126	49 + 147	65 + 195
