

S2 Fig. Individual trajectories of stabilized weights.

Each panel represents a single imputation dataset (32 in total). The X-axis represents the study visits. The Y-axis is the weights (\log_{10} scale). All individual trajectories started in red (not initiated on cinacalcet) and changed to green once initiated on cinacalcet. The crosses (\times) represent the mean at each time point, indicating that the mean was close to the ideal value of 1.0 in all datasets.
