

Supplementary Figure S4 |

Proportions of cells without any detectable foci in non-tc and tc cells of *P. putida* ICE $clc-lacO_{ARRAY}$; *araC, lacI-cfp*; P_{inR} -*echerry* with mutations in critical ICE excision or replication functions.

Error bars indicate calculated standard deviations from the mean of biological replicates. P-value of testing the proportions between non-tc and tc cells across all strains (single-sided t-test, hypothesis that tc cells have higher proportions of cells with any detected foci).
