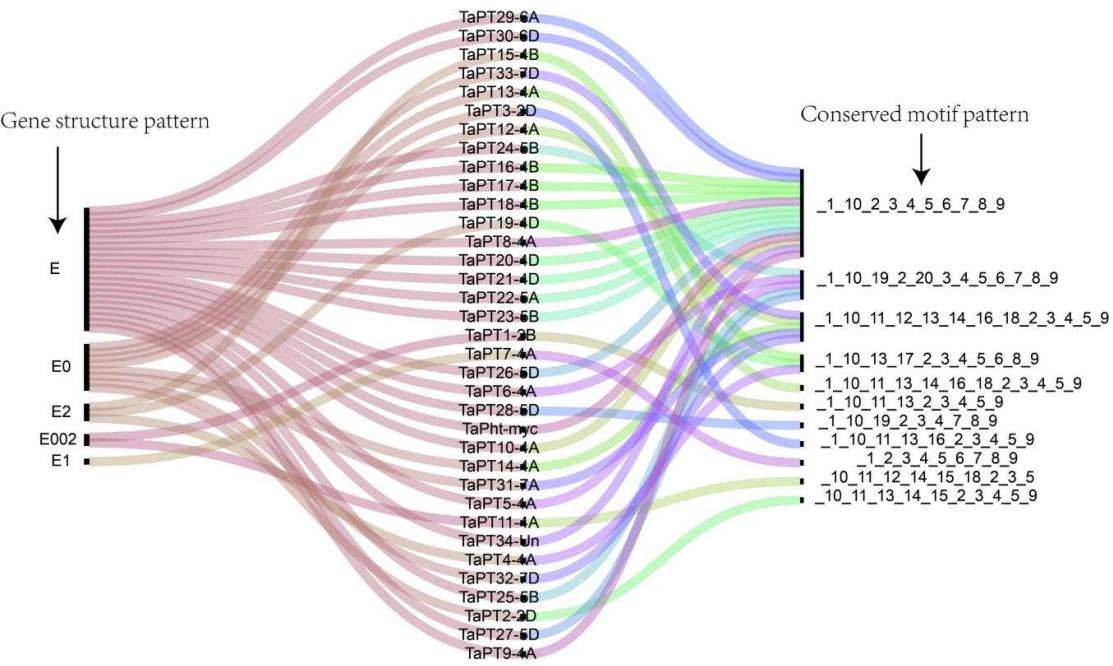

**Figure S2.** Twenty conserved motifs of a set of 57 PHT1 protein sequences identified by MEME and visualized using Weblogo. The parameters were as follows: motif count, 20; motif sites, 6 to 200; motif

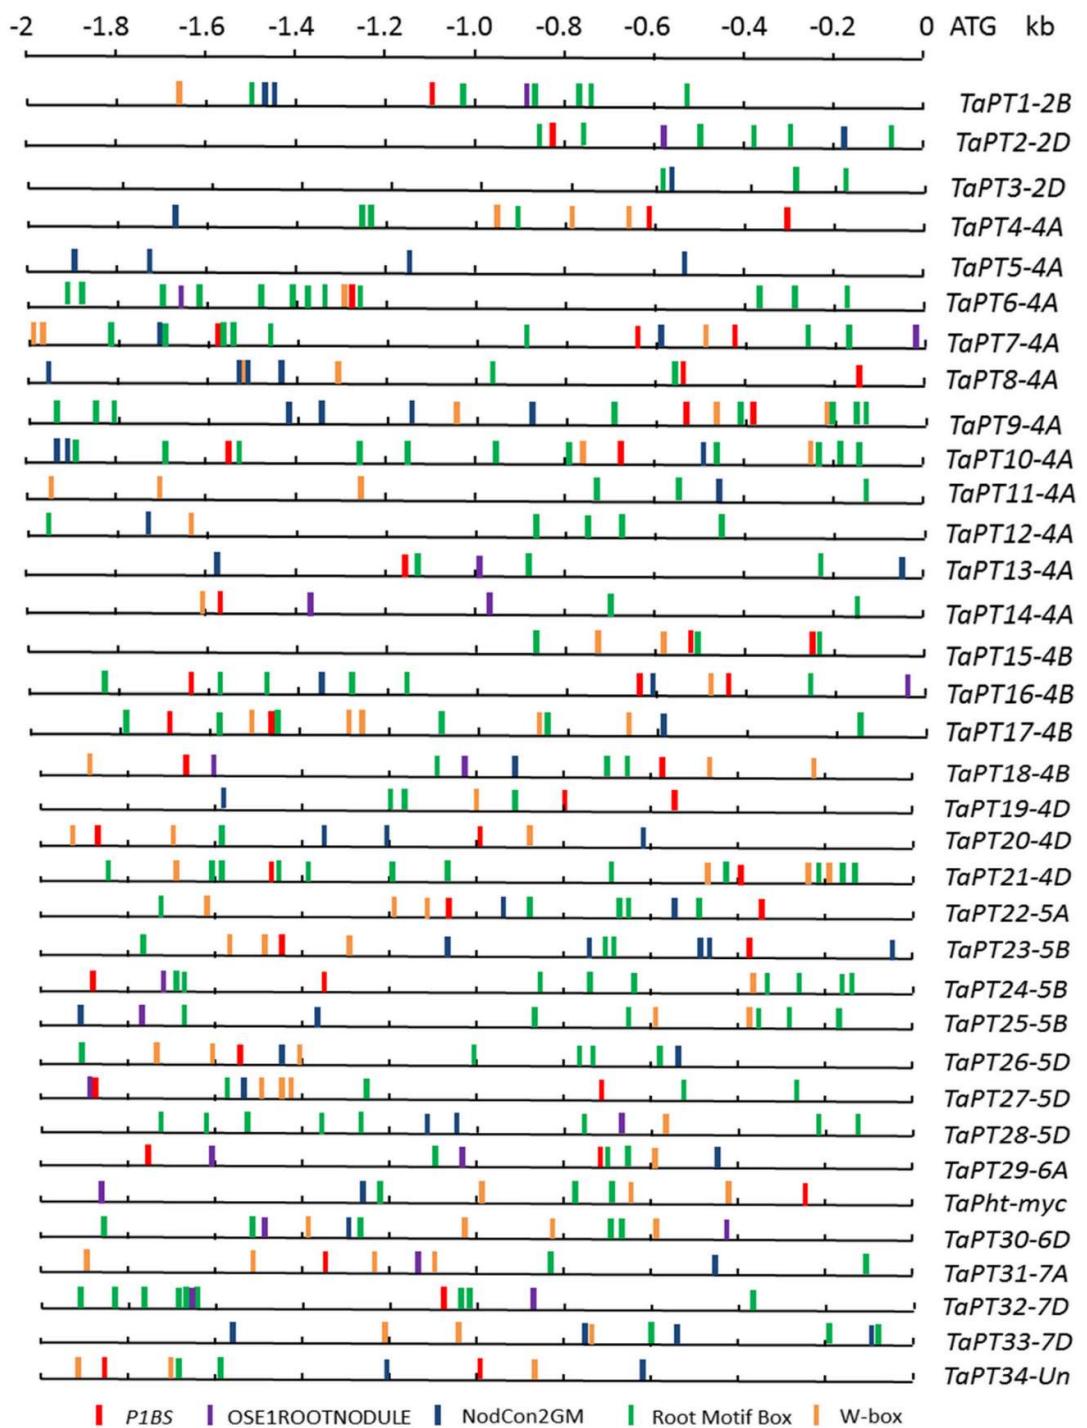

width, 6 to 200; site distribution, zero or one occurrence per sequence; discovery mode, optimal E-value of the motif information content.

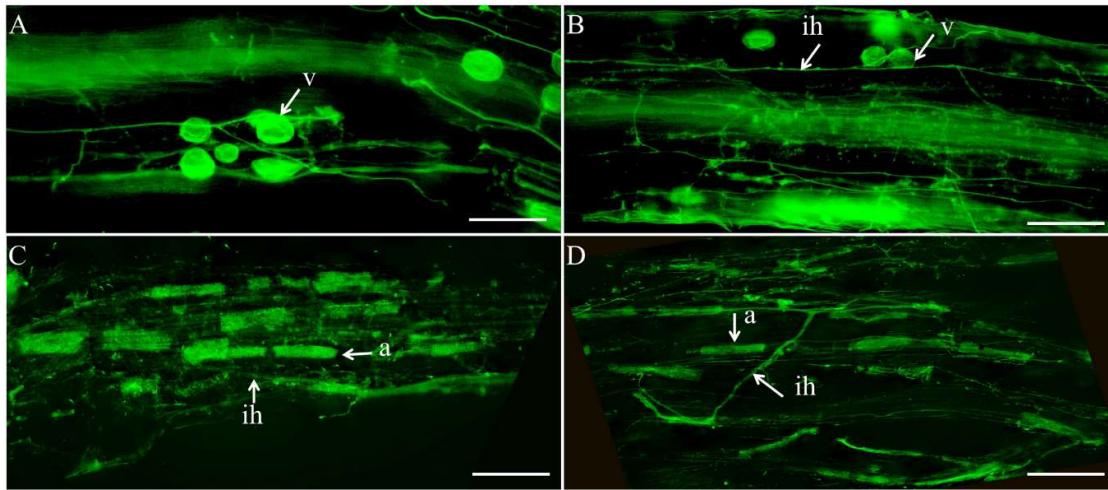

**Figure S3.** Clustering diagram of the PHT1 family in *Arabidopsis*, rice and wheat based on the presence or absence of motifs. (A) Clustering of all PHT1 members based on all the motifs. (B) Clustering of PHT1 proteins containing motifs 1 and 2. (C) Clustering of PHT1 proteins containing motifs 3 and 4. (D) Clustering of PHT1 proteins containing motifs 5, 6 and 7. (E) Clustering of PHT1 proteins containing motifs 8, 9 and 10 were clustered. (F) Clustering of PHT1 proteins containing motifs 11-20.

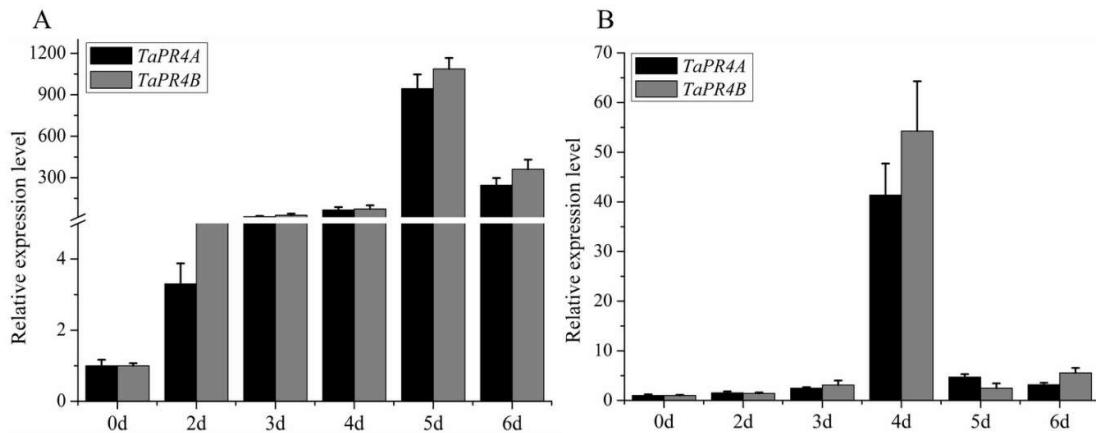

**Figure S4.** Alluvial diagram of correlations between gene structures and motif architectures in members of the PHT1 family in wheat.

**Figure S5.** Putative *cis*-regulatory elements involved in Pi and AM responses in the promoter sequences of the 35 *TaPHT1* genes.

**Figure S6.** AM symbiotic wheat roots stained with WGA-AlexaFluor 488 to reveal fungal structures, including: internal hyphae (ih), vesicles (v) and arbuscules (a). Wheat roots were colonized with *G. versiforme* (A and C) and *F. mosseae* (B and D). Bar=20  $\mu$ m.

**Figure S7.** Relative expression levels of *TaPR4A* and *TaPR4B* marker genes in *Ggt* (A) and *B. sorokiniana* (B) infected wheat roots at indicated time-points. Bars represent means of three biological replications with standard errors.
