

**Figure S1. Disease severity of CEVd-infected NahG tomato plants treated with BTH or GABA with respect to the corresponding non-treated plants.** Symptomatology was scored at 2, 2.15, 2.3 and 2.5 weeks post-inoculation (wpi) using the following scale: symptomless, moderate, severe, and very severe. Data of a representative experiment are shown. A Kruskal-Wallis analysis was performed and different letters indicate significant differences ( $p < 0.05$ ) between the non-treated and chemical treated NahG tomato plants.
