

Supplementary Data

SUPPLEMENTARY FIG. S1. Quantification of adipocyte size in explant cultures. Brightfield images of explants in 96-well multiwells were obtained using a $5\times$ objective at the time points indicated. Images were imported into FIJI, converted to eight-bit grayscale (unprocessed images), binarized (binary image), and processed as described in Materials and Methods. Most adipocytes were captured by this method, and their area recorded.
