

Supplemental Figure 1. Hypoxia results in accumulation of HIF-1α and HIF-2α in human ECs.

Densitometry analysis for Figure 1. Cells were exposed to hypoxia for the time periods specified and total RNA and protein lysates were collected. The changes in HIF-1α and HIF-2α protein levels were evaluated by western blot normalized to β-actin and total protein levels and related to normoxic control. Error bars represent standard error values. * P < 0.05 was considered significant.
