Supplemental Figure Legends:

Figure S1 (related to main Figure 1).

(A) U87, T98G and LN319 glioma cells were lenivirally infected with a scrambled shRNA (PKM2 shRNA, control) or a second shRNA construct targeting human PKM2 (PKM2 shRNA2+). Following drug selection, polyclonal populations were examined by Western blot for cyclin D1, PKM1, PKM2 and β -actin expression

(B) Unsynchronized cells infected with a scrambled shRNA (control) or one of two shRNAs construct targeting human PKM2 were analyzed by quantitative PCR for levels of cyclin D1 mRNA using cyclin D1-specific primers. Values were normalized to β -actin, n=3.

(C,D) U87, T98G and LN319 cells from Figure 1A were serum starved for 48 hrs, after which serum was added and the cells were pulse-labeled with BrdU for the final 15 min prior to harvesting at the times indicated and assessed for the percentage of BrdU+ (C) or mitotic pH3.3+ (D) cells by immunohistochemistry and FACS. *, p<.05, n=3.

(E, F) Cells from panel A and Figure S1A were fixed and incubated with DAPI, after which the cells were examined for DNA content (E, solid bars, control; open bars, PKM2 knock-down), and cell size (F). *, p<.05, n=3. Bar in 1E, F=5 μ m.

(G, H) Levels of PKM2, p27, phosphoY15-Cdk1, and β -actin (G), and cyclin B/Cdk1 activity (normalized to control)(H), in U87, T98, and LN319 cells from Figure S1A, or cells additionally containing scramble siRNA (p27 siRNA-) or one of two siRNAs targeting p27 (p27 siRNA1 & p27 siRNA2). *, p<.05, n=3.

(I) FACS-based cell cycle distribution in U87, T98G, and LN319 cells from panels S1G and H. *, p<.05, n=3.

(J, K) Colony size (J) and centrosome number (K) in U87, T98G, and LN319 cells from panel S1G. Arrows in panel J indicate the mode for each group. *, $p < .05$, $n = 3$.

Figure S2 (related to main Figure 2)

(A) U87, T98G, and LN319 cells from Figure 1A and S1A were analyzed by quantitative PCR for levels of p27 mRNA using p27-specific primers. Values were normalized to β -actin, $n = 3$.

(B) Levels of p27, pS6,S6, phospho 4E-BP1 and 4E-BP1 in U87 cells lentivirally infected with scr shRNA (PKM2 shRNA-) or one of two different shRNA targeting PKM2 (PKM2 shRNA1 or 2) and/or incubated with rapamycin (100 nM, 18 hr).

(C) Control or PKM2 knockdown U87 cells from Figure 1A and S1A were lysed and subjected to sucrose density gradient centrifugation, with subsequent RNA from fractions containing unassembled ribosomal subunits (fractions 2 to 5) or assembled polyribosomes (fractions 6 to 10) analyzed for p27 and β -actin mRNA content by quantitative PCR. *, $p < .05$, $n = 3$.

(D-F) Levels of HuR, p27, and β -actin (D), cell cycle distribution (E), and cap-dependent and cap-independent translation of p27 mRNA (F) in cells from Figure S1A also expressing non-targeted (HuR siRNA-) or one of two HuR-targeted (HuR siRNA1 or HuR siRNA2) siRNA. *, $p < .05$, $n = 3$.

Figure S3 (related to main Figure 3)

(A, B) Levels of HuR, pHuR S 202, and β -actin (A) or histone H3 and tubulin (B) in total cell lysates (A) or the cytoplasmic (C) and nuclear (N) fractions of U87 cells expressing a scramble or PKM2-targeted shRNA as assessed by Western blot.

(C) Control, sodium arsenite-treated (250 μ M, 45 min), or PKM2 shRNA-expressing U87 cells were fixed and subjected to immunofluorescence analysis using an antibody specific for the stress marker TIA-1. The graph represents the percentage of cells analyzed (200 per group) containing at least one foci of TIA-1 staining (stress granule).

Figure S4 (related to main Figure 4)

(A) Western blot analysis of levels of p27, HuR, PKM2, and β actin in total cell lysates from control or PKM2 shRNA 2-expressing U87 cells expressing WT (mM2) or R399E, K367M, or K433E forms of PKM2, or PKM1.

(B) PK activity in U87 and LN319 cell from panel 4F. *, $p < .05$, $n = 3$.

(C-E) FACS-based cell cycle distribution (C), DNA content (D), and centrosome number (E) in U87 (i panels) and LN319 (ii panels) cells expressing a scrambled shRNA (PKM2 shRNA-) or one of two shRNA targeting human PKM2 (PKM1 or 2 shRNA1), and also containing empty vector (PKM2-) or WT (mM2) or R399E, K367M, or K433E forms of PKM2, or PKM1. *, $p < .05$, $n = 3$.

Figure S5 (related to main Figure 5)

(A) 300 individual cells derived from of three primary human GBM each determined by PKM2 immunohistochemistry to have low or high expression of nuclear PKM2 were

analyzed for the nuclear/cytoplasmic percentage distribution of HuR and PKM2 immunofluorescence, and total p27 immunofluorescence. Unsupervised k-means clustering (with k=2) was then used to define the high/low cut-points for nuclear PKM2, cytoplasmic HuR, and p27 expression (listed), and the cells were placed into bins representing all 8 possible combinations of high/low expression, after which a Chi-square goodness of fit test was applied.

Table S1 (related to main Figure 5), Values for the nuclear/cytoplasmic percentage distribution of PKM2 and HuR fluorescence, and for p27 total fluorescence (relative to that noted in an average of 5 immune infiltrate cells in the same field), in 50 cells derived from each of 3 primary GBM expressing high or low levels of nuclear PKM2, respectively.
