Equations S1-S4
Figures S1-S5

Figure S1. The statistics of (a) spatial correlation coefficients and (b) RMSE values for all AOD modeling results from 08/15/2017 to 09/14/2017.

Figure S2. The CATS overpass track (the green line) over the WRF-CMAQ surface $PM_{2.5}$ concentration field (color shading; unit: μg m^{-3}) from the SENS experiment at 11:00 UTC (04:00 PDT) on 09/07/2017.

Figure S3. Modeling performance comparison in terms of RMSE with different *mtry* parameter settings in the RF method.

Figure S4. Modeling performance comparison in terms of RMSE with different *shrinkage* and *interaction.depth* parameter settings in the GBM method.

Figure S5. Comparisons of the non-fire CMAQ_CTRL simulated $PM_{2.5}$ surface concentrations with the AirNow ground observations in June-July, 2017, before the fire episode. (a) monthly averaged $PM_{2.5}$ concentrations (unit: μg m^{-3}) based on the AirNow observations; (b) fractional biases (unit: 100%) based on the monthly averaged CMAQ_CTRL simulations and the AirNow observations.

Equations:

The equations of statistical metrics used for the modeling performance evaluation and comparison in the main text are listed below:

Mean absolute error (MAE):

$$MAE = \frac{\sum_i^n abs(\hat{y_i} - y_i)}{n},$$ (S1)

Fractional bias (FB):

$$FB = \frac{\sum_i^n (\hat{y_i} - y_i)}{\sum_i^n y_i} \times 100\%,$$ (S2)

R-squared (R²):

$$R^2 = \frac{\sum_i^n (\hat{y_i} - \bar{y})^2}{\sum_i^n (y_i - \bar{y})^2} = 1 - \frac{\sum_i^n (y_i - \hat{y_i})^2}{\sum_i^n (y_i - \bar{y})^2},$$ (S3)

Root mean squared error (RMSE):

$$RMSE = \sqrt{\frac{\sum_i^n (\hat{y_i} - y_i)^2}{n}},$$ (S4)

In Equations S1-S4, y_i is the ith observed value, $\hat{y_i}$ is the ith predicted value, $\bar{y}$ is the mean value of all observations, and n is the sample size of observations.
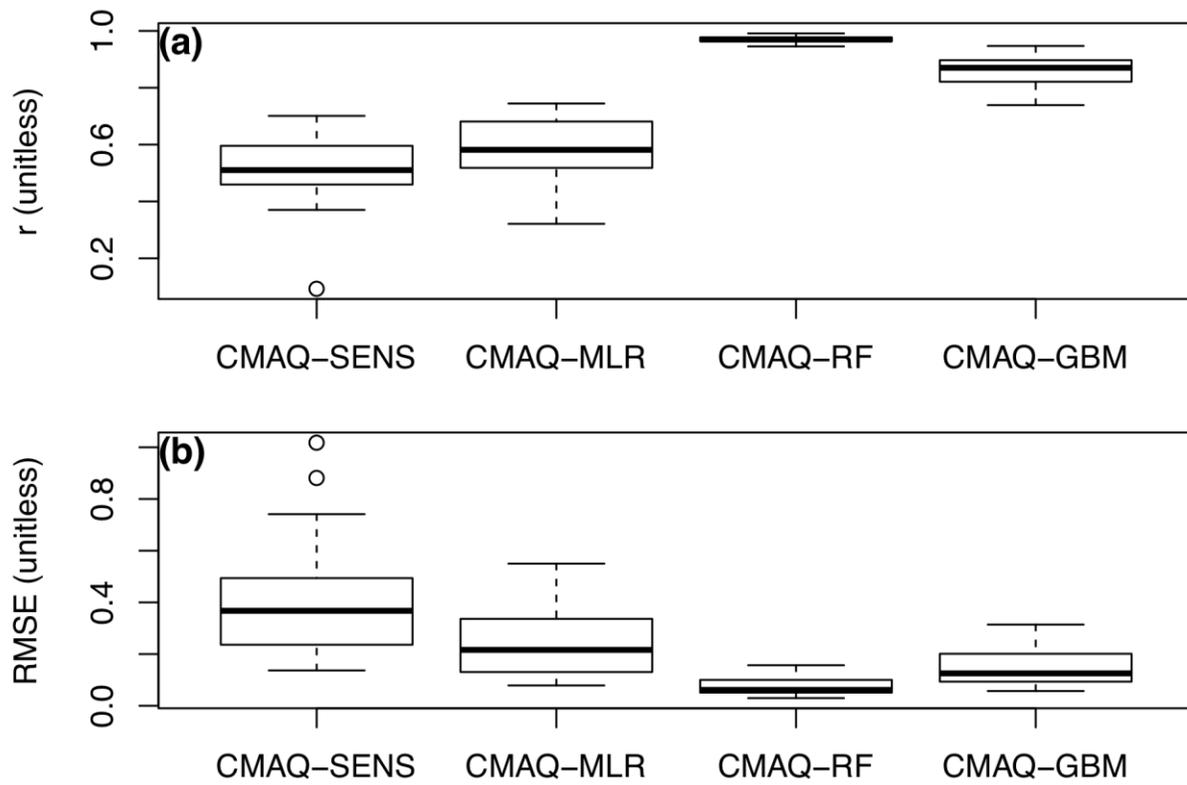

Figure S1. The statistics of (a) spatial correlation coefficients and (b) RMSE values for all AOD modeling results from 08/15/2017 to 09/14/2017.
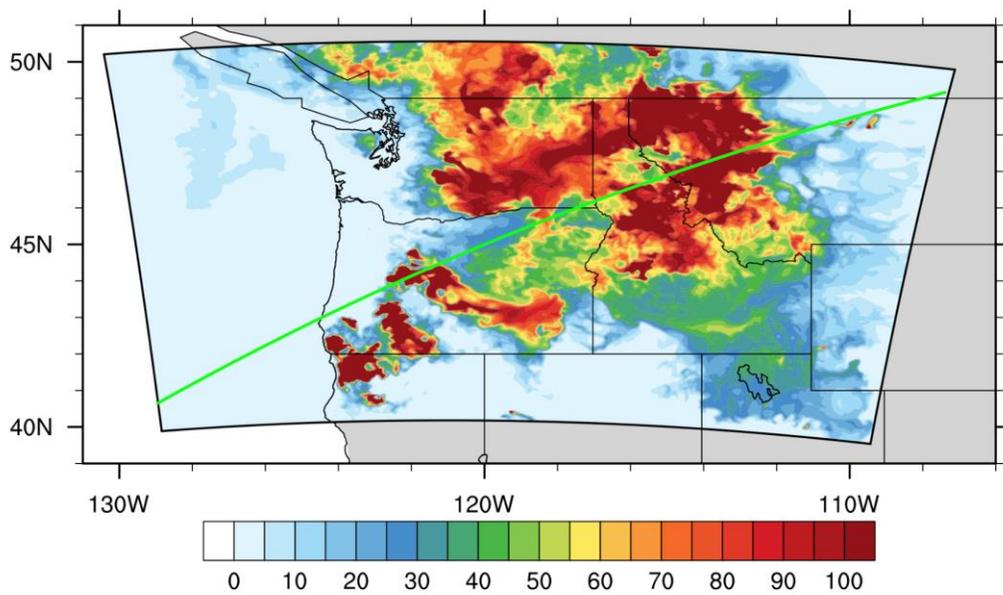

Figure S2. The CATS overpass track (the green line) over the WRF-CMAQ surface PM$_{2.5}$ concentration field (color shading; unit: μg m^{-3}) from the SENS experiment at 11:00 UTC (04:00 PDT) on 09/07/2017.
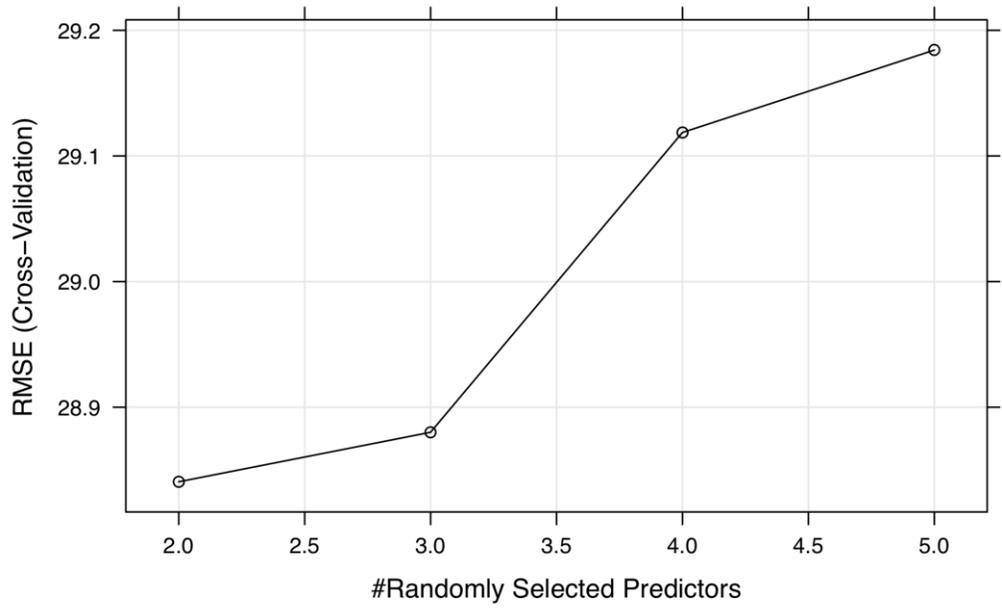

Figure S3. The modeling performance comparison in terms of RMSE with different *mtry* parameter settings in the RF method. Here *mtry* is the number of variables randomly sampled as candidates at each split.
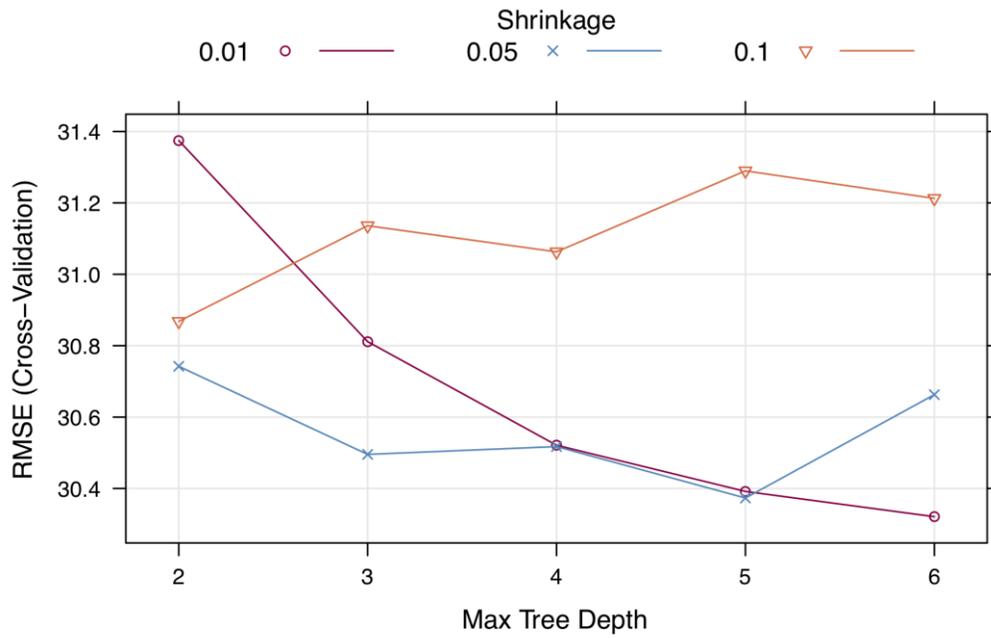

Figure S4. The modeling performance comparison in terms of RMSE with different *shrinkage* and *interaction.depth* parameter settings in the GBM method. Here *shrinkage* is the learning rate applied to each tree in the expansion, and *interaction.depth* is the maximum depth of each tree allowing variable interactions.

Figure S5. Comparisons of the non-fire CMAQ_CTRL simulated PM$_{2.5}$ surface concentrations with the AirNow ground observations in June-July, 2017, before the fire episode. (a) monthly averaged PM$_{2.5}$ concentrations (unit: μg m^{-3}) based on the AirNow observations; (b) fractional biases (unit: 100%) based on the monthly averaged CMAQ_CTRL simulations and the AirNow observations;
