

Appendix 5: Characteristics of before-after studies (scoping review)

Study #	Author	Year	Title	Study design	Country	Urban/Rural	Study population	Population characteristics	Method of participant selection	Sample size	Study duration	Type of facility	Intervention
1	Abramczyk et al	2011	Preventing catheter-associated infections in the Pediatric Intensive Care Unit: impact of an educational program surveying policies for insertion and care of central venous catheters in a Brazilian teaching hospital	Before-After	Brazil	Urban	Pediatric patients	Patients in the pediatric ICU for more than 24 hours	All patients visiting the unit for more than 24 hours during study period were enrolled	255 Patients	16 months	Tertiary - hospital	Educational program - Disinfection of hub connection

Study #	Author	Year	Title	Study design	Country	Urban/Rural	Study population	Population characteristics	Method of participant selection	Sample size	Study duration	Type of facility	Intervention
2	Allegranzi et al	2018	A multimodal infection control and patient safety intervention to reduce surgical site infections in Africa: a multicentre, before-after, cohort study	Before-After	Kenya, Uganda (two hospitals), Zambia, and Zimbabwe	Urban and Rural	All-age patients admitted to the HCF for a major operation	Patients receiving major elective and emergency operations in the HCFs were eligible for inclusion	Patients receiving major elective and emergency operations were eligible for inclusion	4 hospitals. 4322 operations were followed up (1604 at baseline, 1827 at follow-up, and 891 in the sustainability period)	30 months	Tertiary - hospital	Multimodal intervention including provision of antiseptics and education

Study #	Author	Year	Title	Study design	Country	Urban/Rural	Study population	Population characteristics	Method of participant selection	Sample size	Study duration	Type of facility	Intervention
3	Alp et al	2014	Evaluation of the effectiveness of an infection control program in adult intensive care units: a report from a middle-income country	ITS but data collected and analysed as a Before-After study	Turkey	Urban	Adults patients in the ICU	Patients in ICU	Patient records	Number of patients N/R 4 ICUs within 1 hospital	9 years (108 months)	Tertiary - hospital	Increased hand basins and alcohol-based hand rub availability phased in along with wider intervention bundle

Study #	Author	Year	Title	Study design	Country	Urban/Rural	Study population	Population characteristics	Method of participant selection	Sample size	Study duration	Type of facility	Intervention
4	Alvarez-Moreno et al	2016	Multicenter study in Colombia: Impact of a multidimensional International Nosocomial Infection Control Consortium (INICC) approach on central line-associated bloodstream infection rates	Before-After	Colombia	Urban	Pediatric and adult patients in the ICUs	Patients in adult ICU and patients in pediatric ICU	N/R	Total of 2,988 patients, hospitalized for 17,370 days, with a total of 13,263 CL days, at 4 hospitals in the following 3 types of ICUs: pediatric (n = 424), coronary (n = 373), and medical-surgical (n = 2,191)	83 months	Secondary/Tertiary - hospital	Multidimensional infection control approach

Study #	Author	Year	Title	Study design	Country	Urban/Rural	Study population	Population characteristics	Method of participant selection	Sample size	Study duration	Type of facility	Intervention
5	Apisarnthanarak et al	2014	Effectiveness of infection prevention measures featuring advanced source control and environmental cleaning to limit transmission of extremely-drug resistant <i>Acinetobacter baumannii</i> in a Thai intensive care unit: An analysis before and after extensive flooding	Before-After	Thailand	Urban	All patients admitted to the medical ICU and intubated	All patients admitted to the medical ICU between May 1, 2011, and December 31, 2012 and intubated	All patients	1365 patients	30 months	Tertiary - hospital	Disinfection and hygiene among a larger intervention

Study #	Author	Year	Title	Study design	Country	Urban/Rural	Study population	Population characteristics	Method of participant selection	Sample size	Study duration	Type of facility	Intervention
6	Apisarnthanarak et al	2010	Effectiveness of a catheter-associated bloodstream infection bundle in a Thai tertiary care center: a 3-year study	Before-After	Thailand	Urban	All patients age 15 years or older who had a CVC	All consecutive patients age 15 years or older admitted to the hospital in all units between July 1, 2005, and June 30, 2008.	All hospitalized patients age 15 years or older who had a CVC were enrolled	3369 patients	36 months	Tertiary - hospital	Bundled infection control practices

Study #	Author	Year	Title	Study design	Country	Urban/Rural	Study population	Population characteristics	Method of participant selection	Sample size	Study duration	Type of facility	Intervention
7	Azab et al	2015	Reducing ventilator-associated pneumonia in neonatal intensive care unit using "VAP prevention Bundle": a cohort study	Before-After	Egypt	Urban	Neonates in the ICU	Neonates who had mechanical ventilation for ≥ 48 h	All patients included	143 patients	15 months	Tertiary - hospital	VAP prevention bundle

Study #	Author	Year	Title	Study design	Country	Urban/Rural	Study population	Population characteristics	Method of participant selection	Sample size	Study duration	Type of facility	Intervention
8	Guanche-Garcell	2013	Effectiveness of a multidimensional approach for the prevention of ventilator-associated pneumonia in an adult intensive care unit in Cuba: findings of the International Nosocomial Infection Control Consortium (INICC)	Before-After	Cuba	Urban	Adult patients in ICU	Adult patients on mechanical ventilation in ICU	All adult patients on mechanical ventilation in ICU at time of the study	1075 patients	50 months	Secondary/Tertiary - hospital	Bundle of Infection control measures

Study #	Author	Year	Title	Study design	Country	Urban/Rural	Study population	Population characteristics	Method of participant selection	Sample size	Study duration	Type of facility	Intervention
9	Jagi et al	2013	Impact of an international nosocomial infection control consortium multidimensional approach on central line-associated bloodstream infection rates in adult intensive care units in eight cities in India	Before-After	India	Urban	Adults in ICUs	Adults in the ICU	All ICU hospital patients	35650 patients	126 months	Secondary/Tertiary - hospital	Hand hygiene, disinfecting skin and medical equipment among a wider intervention

Study #	Author	Year	Title	Study design	Country	Urban/Rural	Study population	Population characteristics	Method of participant selection	Sample size	Study duration	Type of facility	Intervention
10	Kurlat et al	1998	Infection control strategies in a neonatal intensive care unit in Argentina	Before-After	Argentina	Urban	Neonates in ICU	Neonatal intensive care unit patients	All patients admitted to the NICU during study period	725 neonates at baseline 728 neonates end line	24 months	Tertiary - hospital	Guidelines created and staff trained in guidelines which include handwashing and sterilization
11	Leblebicioglu et al	2013	Impact of a multidimensional infection control approach on catheter-associated urinary tract infection rates in adult intensive care units in 10 cities of Turkey: International Nosocomial Infection Control Consortium findings (INICC)	Before-After	Turkey	Urban	All patients in ICU	Patients in ICU	All ICU patients in the hospitals during study period	4231 patients in 13 ICUs in 10 hospitals across 10 cities	82 months	Secondary/Tertiary - hospital	Mixed approach including hand hygiene and sterilization of equipment

Study #	Author	Year	Title	Study design	Country	Urban/Rural	Study population	Population characteristics	Method of participant selection	Sample size	Study duration	Type of facility	Intervention
12	Leblebicioglu et al	2013	Impact of a multidimensional infection control approach on central line-associated bloodstream infections rates in adult intensive care units of 8 cities of Turkey: findings of the International Nosocomial Infection Control Consortium (INICC)	Before-After	Turkey	Urban	Adult patients in ICU	Patients in ICU	All ICU adult patients in participating hospitals	4017 patients in 13 ICUs across 13 hospitals	76 months	Secondary/Tertiary - hospital	Mixed approach including hand hygiene and sterilization of equipment

Study #	Author	Year	Title	Study design	Country	Urban/Rural	Study population	Population characteristics	Method of participant selection	Sample size	Study duration	Type of facility	Intervention
13	Leblebicioglu et al	2013	Effectiveness of a multidimensional approach for prevention of ventilator-associated pneumonia in 11 adult intensive care units from 10 cities of Turkey: findings of the International Nosocomial Infection Control Consortium (INICC)	Before-After	Turkey	Urban	Adult patients in ICU	Patients in ICU	All ICU adult patients in participating hospitals	4312 across 11 adult ICUs from 10 hospitals	64 months	Secondary/Tertiary - hospital	Mixed approach including hand hygiene and sterilization of equipment

Study #	Author	Year	Title	Study design	Country	Urban/Rural	Study population	Population characteristics	Method of participant selection	Sample size	Study duration	Type of facility	Intervention
14	Lenz et al	2018	Impact of a program aimed at reducing catheter-related infections implemented in nine pediatric intensive care units in Argentina	Before-After	Argentina	Urban	Pediatric patients in ICU	Pediatric patients who had a central venous catheter during hospitalization	All patients in the pediatric ICUs. PICUs were selected from public hospitals based on their prior participation in a quality improvement program that had been implemented within 3 years earlier and their compliance with implementation and recording feasibility requirements	9 PICUs across 7 hospitals	11 months	Secondary/Tertiary - hospital	A bundle of measures based on health care staff training on catheter insertion, hand hygiene, and checklists

Study #	Author	Year	Title	Study design	Country	Urban/Rural	Study population	Population characteristics	Method of participant selection	Sample size	Study duration	Type of facility	Intervention
15	Marra et al	2010	Impact of a program to prevent central line-associated bloodstream infection in the zero tolerance era	Before-After	Brazil	Urban	All patients in the ICU and SDU (step-down units)	All ICU and SDU (step-down units) patients requiring central venous lines	All patients in the ICUs, SDUs during study period	Total patient days = 99,165 days	48 months	Tertiary - hospital	Intervention bundle including hand hygiene and sterilization
16	Mehta et al	2013	Effectiveness of a multidimensional approach for prevention of ventilator-associated pneumonia in 21 adult intensive-care units from 10 cities in India: findings of the International Nosocomial Infection Control Consortium (INICC)	Before-After	India	Urban	Adult patients in ICU	Adult patients in ICU	All ICU adult patients at time of study	46,954 patients from 21 ICUs from 14 hospitals	87 months	Secondary/Tertiary - hospital	Bundle which included adherence to hand hygiene (HH) guidelines and oral care with antiseptic solution among many others

Study #	Author	Year	Title	Study design	Country	Urban/Rural	Study population	Population characteristics	Method of participant selection	Sample size	Study duration	Type of facility	Intervention
17	Murni et al	2015	Reducing hospital-acquired infections and improving the rational use of antibiotics in a developing country: an effectiveness study	Before-After	Indonesia	Urban	Pediatric patients in the ICU and pediatric ward	Pediatric patients who were expected to remain in the pediatric wards or pediatric ICU for more than 48 h	All children admitted to the pediatric intensive care unit and pediatric wards were observed	1 hospital, 2646 patients	27 months	Tertiary - hospital	Multifaceted intervention including hand hygiene

Study #	Author	Year	Title	Study design	Country	Urban/Rural	Study population	Population characteristics	Method of participant selection	Sample size	Study duration	Type of facility	Intervention
18	Navoa et al	2013	Impact of an International Nosocomial Infection Control Consortium multidimensional approach on catheter-associated urinary tract infections in adult intensive care units in the Philippines: International Nosocomial Infection Control Consortium (INICC) findings	Before-After	Philippines	Urban	Adults in ICUs	Adults in ICU	All patients in ICU during study period	3183 patients hospitalized in 4 ICUS in 2 hospitals	60 months	Secondary/Tertiary - hospital	Multidimensional approach including hand hygiene sterilization guidelines among other measures

Study #	Author	Year	Title	Study design	Country	Urban/Rural	Study population	Population characteristics	Method of participant selection	Sample size	Study duration	Type of facility	Intervention
19	Ng Y.Y et al	2015	Impact of infection control training for interns on PICU-acquired bloodstream infections in a middle-income country	ITS but data collected and analyzed as a Before-After study	Malaysia	Urban	Pediatric patients in ICU	Pediatric patients admitted to the ICU between 1 January 2008 and 31 December 2009	All patients admitted to ICU during study period	721 PICU patients. 1 medical centre	24 months	Tertiary - hospital	Training in hand hygiene and aseptic techniques for accessing vascular catheters

Study #	Author	Year	Title	Study design	Country	Urban/Rural	Study population	Population characteristics	Method of participant selection	Sample size	Study duration	Type of facility	Intervention
20	Ogwang et al	2013	Prevalence of hospital-associated infections can be decreased effectively in developing countries	Before-After	Uganda	Urban	All patients in acute care unit (ACU)	All patients in ACU admitted to hospital not less than two days before the survey were eligible to participate in the prevalence survey.	Eligible patients were identified by examining inpatient medical charts	728 patients, 1 hospital	20 months	Tertiary - hospital	Infection control Programme including hand hygiene, disinfection of skin, etc.

Study #	Author	Year	Title	Study design	Country	Urban/Rural	Study population	Population characteristics	Method of participant selection	Sample size	Study duration	Type of facility	Intervention
21	Rosenthal et al	2006	Impact of an infection control program on rates of ventilator-associated pneumonia in intensive care units in 2 Argentinean hospitals	Before-After	Argentina	Urban	Adult patients in ICU and on mechanical ventilation	All adult patients who received MV for at least 24 hours	All eligible patients who were admitted to the study units	801 patients in 4 ICUs in 2 hospitals	24 months	Tertiary - hospital	Multi-component Infection control programme
22	Rosenthal et al	2005	Reduction in nosocomial infection with improved hand hygiene in intensive care units of a tertiary care hospital in Argentina	Before-After	Argentina	Urban	All patients in ICUs	All patients in ICUs	All patients in ICUs during study period	9596 bed days 2 ICUs, 1 hospital *number of patients not given	21 months	Tertiary - hospital	Hand hygiene

Study #	Author	Year	Title	Study design	Country	Urban/Rural	Study population	Population characteristics	Method of participant selection	Sample size	Study duration	Type of facility	Intervention
23	Rosenthal et al	2012	Impact of a multidimensional infection control strategy on central line-associated bloodstream infection rates in pediatric intensive care units of five developing countries: findings of the International Nosocomial Infection Control Consortium (INICC)	Before-After	Colombia, India, Mexico, Philippines and Turkey	Urban	Pediatric patients in ICUs	Pediatric patients in ICU	All eligible patients during study period	1,986 patients 9 PICUs in 9 hospitals	87 months	Secondary/Tertiary - hospital	INICC multidimensional infection control program including hand hygiene and disinfection

Study #	Author	Year	Title	Study design	Country	Urban/Rural	Study population	Population characteristics	Method of participant selection	Sample size	Study duration	Type of facility	Intervention
24	Rosenthal et al	2012	Impact of a multidimensional infection control strategy on catheter-associated urinary tract infection rates in the adult intensive care units of 15 developing countries: findings of the International Nosocomial Infection Control Consortium (INICC)	Before-After	Argentina, Brazil, China, Colombia, Costa Rica, Cuba, India, Lebanon, Macedonia, Mexico, Morocco, Panama, Peru, Philippines, and Turkey.	Urban	Adult patients in ICU	Adult patients in ICU with a urinary catheter (UC)	All eligible patients in ICU during study period	56,429 patients 57 AICUs	131 months	Secondary/Tertiary - hospital	"INICC multidimensional infection control program including hand hygiene and disinfection "

Study #	Author	Year	Title	Study design	Country	Urban/Rural	Study population	Population characteristics	Method of participant selection	Sample size	Study duration	Type of facility	Intervention
25	Von Dolinger de Brito et al	2007	Effect of neonatal intensive care unit environment on the incidence of hospital-acquired infection in neonates	Before-After	Brazil	Urban	Neonates in the ICU	N/R	N/R	1811 neonates	54 months	Tertiary - hospital	Refurbishment of wards - improved sink:cot ratios

Study #	Author	Year	Title	Study design	Country	Urban/Rural	Study population	Population characteristics	Method of participant selection	Sample size	Study duration	Type of facility	Intervention
26	Zhou et al	2015	Successful reduction in central line-associated bloodstream infections in a Chinese neonatal intensive care unit	Before-After	China	Urban	Neonates in the ICU	All newborn patients with central line in dwelling for >48 hours and who had been hospitalized in the NICU for >=5 days during the study period	All eligible newborns in NICU at time of study	171 newborns	36 months	Tertiary - hospital	infection prevention bundle - including hand hygiene and sterile practices

Study #	Author	Year	Title	Study design	Country	Urban/Rural	Study population	Population characteristics	Method of participant selection	Sample size	Study duration	Type of facility	Intervention
27	Zhou et al	2013	Efficacy of an infection control program in reducing ventilator-associated pneumonia in a Chinese neonatal intensive care unit	Before-After	China	Urban	Neonates in ICU	All neonates who received mechanical ventilation for at least 48 hours and were hospitalized in the NICU for >5 days during 3 epochs were included	All eligible neonates in NICU at time of study	491 neonate patients	36 months	Tertiary - hospital	Bundle of comprehensive preventive measures against VAP - including hand hygiene and disinfection training

Study #	Author	Year	Description of the intervention	WASH only/Combined	WASH intervention description	Length of the intervention	Length of post-intervention follow up	Definition of HCAI used
1	Abramczyk et al	2011	Didactic lectures, totaling 6 hours, were given to physicians, fellows and nursing staff of the unit using a slide show. The most important messages were: (I) catheters should be inserted using maximal barrier recommendations; (II) all inserted catheters should be removed as soon as possible; (III) hub connection disinfection with 70% alcohol before and after manipulation; (IV) site insertion CVC should be protected with impermeable plastic during bath; (V) fundamental cooperation of all unit members. No preferential site of insertion was recommended.	Combined	Educational messages given - hub connection should be disinfected with 70% alcohol before and after manipulation	2 months	7 months	<p>CVC-AI were defined according to the CDC criteria of 1988</p> <p>Exit site infections were defined as erythema, tenderness, induration or purulence affecting 2 cm of the skin at the exit site of the catheter.</p> <p>Primary bloodstream infections were defined as bacteraemia (or fungaemia), for which there was no documented distal source, and included infections resulting from insertion of a central intravenous line. The infection was categorized either as microbiologically documented or as clinical sepsis.</p> <p>Infections were regarded as ICU acquired infections if they occurred during PICU stay or within 48 hours of discharge from the unit.</p> <p>The presence of bacteremia was defined as the isolation of a pathogen from a blood culture of a patient with symptoms suggestive of infection.</p>

Study #	Author	Year	Description of the intervention	WASH only/Combined	WASH intervention description	Length of the intervention	Length of post-intervention follow up	Definition of HCAI used
2	Allegranzi et al	2018	Provision of antiseptic soap to patients for bathing and educational intervention for hospital staff	Combined	<p>Provision of antiseptic soap to patients for bathing; optimise patient skin preparation, including local production of alcohol-based and chlorhexidine-based skin disinfection product; optimise surgical hand preparation, including local production of alcohol-based hand rub product and appropriate rubbing technique.</p> <p>Educational intervention on these techniques for hospital staff</p>	Ongoing	7-12 months	Surgical site infection (SSI) is defined according to the CDC-NHSN

Study #	Author	Year	Description of the intervention	WASH only/Combined	WASH intervention description	Length of the intervention	Length of post-intervention follow up	Definition of HCAI used
3	Alp et al	2014	Audits and feedback introduced 2009, 2009- increased hand basins and alcohol-based hand rub availability 2011 - bundle strategy introduced	Combined	Audits and feedback introduced 2009, 2009- increased hand basins and alcohol-based hand rub availability 2011 - bundle strategy introduced (WASH components = distribution of chlorhexidine-containing soap, hand hygiene compliance audits, staff compliance feedback and daily chlorhexidine bathing of ICU patients)	Unclear: Audits and feedback - 2009 -2012 (3 years) Hand basins and alcohol rub - 2009-2012 = 3 years Bundle introduced 2011 = 1 year	0 months	Text refers to: Horan TC, Andrus M, Dudeck MA. CDC/NHSN surveillance definition of health care associated infection and criteria for specific types of infections in the acute care setting. Am J Infect Control 2008;36:309-32

Study #	Author	Year	Description of the intervention	WASH only/Combined	WASH intervention description	Length of the intervention	Length of post-intervention follow up	Definition of HCAI used
4	Alvarez-Moreno et al	2016	The INICC multidimensional approach and the ISOS, which included a bundle of 1) infection prevention practice interventions - guidelines (handwashing, sterilizing, etc.), education (on the guidelines including hand hygiene and sterilizing), outcome surveillance, process surveillance, feedback on CLABSI rates and consequences, and performance feedback of process surveillance	Combined	The INICC multidimensional approach and the ISOS, which included a bundle of 1) infection prevention practice interventions - guidelines (handwashing, sterilizing (use a chlorhexidine-based antiseptic for skin preparation), etc.), education (on the guidelines including hand hygiene and sterilizing), outcome surveillance, process surveillance, feedback on CLABSI rates and consequences, and performance feedback of process surveillance	Varies across hospitals 7 months - 19 months	N/R	Applied CDC-NHSN definitions for CLABSI published by the CDC-NSHN in 1991

Study #	Author	Year	Description of the intervention	WASH only/Combined	WASH intervention description	Length of the intervention	Length of post-intervention follow up	Definition of HCAI used
5	Apisarntharak et al	2014	In P2 (intervention period), all P1 (baseline period) interventions were continued, but bleach was used to clean environmental surfaces (e.g., bed rails, sinks, overbed tables, infusion pumps, surrounding counter tops) twice daily, and advanced source control was introduced. Advanced source control consisted of bathing patients once daily with 2% chlorhexidine in aqueous solution and performing oral care 4 times daily with 2% chlorhexidine. All P2 interventions were continued during P3, except an appropriate detergent-disinfectant replaced bleach.	Combined	Hand and environmental cleaning with disinfectant, bathing patients with chlorhexidine, and performing oral cleaning with chlorhexidine. Hand hygiene promotion and monthly feedback on hand hygiene compliance	5.5 months	12.5 months	<p>MDR A baumannii was defined as an A baumannii isolate that was resistant to any 3 of 5 classes of systemic antibiotics (cephalosporins, aztreonam, carbapenems, aminoglycosides, fluoroquinolones), whereas XDR A baumannii was defined as an A baumannii isolate that was resistant to all currently available systemic antibiotics (ie, cephalosporins, aztreonam, carbapenems, aminoglycosides, fluoroquinolones, and sulbactam), except polymyxin B or tigecycline.</p> <p>Nosocomial infections were defined using Centers for Disease Control and Prevention criteria</p> <p>MICU acquisition of an XDR A baumannii surveillance isolate was defined as detection of this microorganism by active surveillance culture >48 hours after MICU admission, following a negative active surveillance culture result at the time of MICU admission.</p>

Study #	Author	Year	Description of the intervention	WASH only/Combined	WASH intervention description	Length of the intervention	Length of post-intervention follow up	Definition of HCAI used
6	Apisarnthanarak et al	2010	<p>Period 1 = baseline Period 2 , alcohol- based hand rub dispensers installed and the CA-BSI prevention bundle was implemented. Components of CA-BSI bundle included (1) hospital-wide HCW education on proper hand hygiene, (2) education of physicians on the use of maximum sterile barrier precautions during CVC insertion, (3) use of a chlorhexidine based skin preparation, (4) optimization of CVC insertion practices, (5) daily review of the need for CVC in each patient.</p> <p>The educational component was for medical staff and was repeated every 4 months.</p> <p>During period 3 an intensified hand hygiene intervention was introduced. This intervention included similar but continuous education on hand hygiene and the importance of complying with the CA-BSI bundle for all involved HCWs</p>	Combined	Provision of alcohol-based hand rub dispensers, hand hygiene education, education on using sterile barrier precautions during CVC insertion, skin preparation with chlorhexidine.	12 months (CABSI bundle) Followed by 12 months CABSI bundle with intensified hand hygiene intervention	Measures taken at 12 months and 24 months - intervention implemented throughout	The definition of CA-BSI definition used in this study was derived from Centers for Disease Control and Prevention (CDC) definitions.

Study #	Author	Year	Description of the intervention	WASH only/Combined	WASH intervention description	Length of the intervention	Length of post-intervention follow up	Definition of HCAI used
7	Azab et al	2015	<p>Routine infection control (hand hygiene, sterilization of equipment)</p> <p>Bundle included:</p> <ul style="list-style-type: none"> - Head-of-bed elevation 300-450. - Re-enforcement of hand hygiene practice. - Sterile suction and handling of respiratory equipment. - Intubation, re-intubation and endotracheal tube (ETT) suction as strictly indicated by unit protocol. - Change ventilator circuit if visibly soiled or mechanically malfunctioning (document) - Proper timed mouth care with normal saline and suction of oropharyngeal secretion. - Daily evaluation for readiness for extubation to nasal continuous airway pressure (NCPAP) at morning round, and sedation vacation for sedated patient 	Combined	<p>Bundle - WASH components include:</p> <p>Reinforcing hand hygiene of medical staff, sterilization of equipment, mouth hygiene of patients.</p>	6 months	Collected immediately after - 0 months	VAP

Study #	Author	Year	Description of the intervention	WASH only/Combined	WASH intervention description	Length of the intervention	Length of post-intervention follow up	Definition of HCAI used
8	Guanche-Garcell	2013	Multidimensional approach included the following measures: a bundle of infection control interventions, education, outcome surveillance, process surveillance, feedback of VAP rates and performance feedback of infection control practices	Combined	Bundle included (among other measures): Performance of comprehensive regular oral care with an antiseptic solution, performance of direct observation of hand hygiene compliance, adherence to hand-hygiene guidelines	47 months	0 months	<p>The INICC Surveillance Program applies the definitions for device associated infections (DAIs) developed by the U.S. Centers for Disease Control and Prevention (CDC) for the National Nosocomial Infection Surveillance System (NNIS)/National Health Safety Network (NHSN) program</p> <p>CDC NHSN definitions for VAP were applied whereby VAP is diagnosed in a mechanically ventilated patient with a chest radiograph showing new or progressive infiltrates, consolidation, cavitation, or pleural effusion. The patient also must meet at least one of the following criteria: new onset of purulent sputum or change in character of sputum; organism cultured from the blood; or isolation of an etiologic agent from a specimen obtained by tracheal aspirate, bronchial brushing or bronchoalveolar lavage, or biopsy</p>

Study #	Author	Year	Description of the intervention	WASH only/Combined	WASH intervention description	Length of the intervention	Length of post-intervention follow up	Definition of HCAI used
9	Jagi et al	2013	The International Nosocomial Infection Control Consortium (INICC) approach was implemented, which included a bundle of infection control interventions, education, outcome surveillance, process surveillance, feedback on CLABSI rates and consequences, and performance feedback	Combined	Bundle included hand hygiene, chlorhexidine for skin preparation, disinfecting medical equipment	ICUs had undergone different lengths of intervention. The average length of the intervention period was 17.54 months (standard deviation 8.9 months, range 5–36 months).	36 months	Definition from CDC/NHSN (US Centers for Disease Control and Prevention/ National Healthcare Safety Network)

Study #	Author	Year	Description of the intervention	WASH only/Combined	WASH intervention description	Length of the intervention	Length of post-intervention follow up	Definition of HCAI used
10	Kurlat et al	1998	The intervention strategy was a three-step programme. Step 1 included surveillance of NICU practices to establish possible causes for high endemic infection rates. Step 2 was dedicated to the development of guidelines for those practices that were judged to be responsible for high infection rates. Guidelines for handwashing, infant handling and use of gloves, care of intravenous lines, including dressing and handling of three-way-stopcock, and suction of the endotracheal tube were established. Step 3 - training personnel in guidelines	Combined	Guidelines created and staff trained in guidelines which include handwashing and sterilization	12 months	0 months	N/R

Study #	Author	Year	Description of the intervention	WASH only/Combined	WASH intervention description	Length of the intervention	Length of post-intervention follow up	Definition of HCAI used
11	Leblebicioglu et al	2013	a multidimensional approach that included bundle of infection control interventions, education, surveillance and feedback on CAUTI rates, process surveillance, and performance feedback.	Combined	HH before insertion and manipulation of the urinary catheter, disinfection of skin and equipment, monitoring/observation of hand hygiene compliance in HCWs	The average length of intervention was 22.4 months, standard deviation 17.2 (range, 4-60).	0 months	Definitions of the Centers for Disease Control and Prevention/National Healthcare Safety Network used

Study #	Author	Year	Description of the intervention	WASH only/Combined	WASH intervention description	Length of the intervention	Length of post-intervention follow up	Definition of HCAI used
12	Leblebicioglu et al	2013	1- bundle of infection control interventions, 2- education, 3- outcome surveillance, 4- process surveillance, 5- feedback of CLAB rates, and 6- performance feedback on infection control practices.	Combined	Hand hygiene, disinfection of skin and equipment, daily bathing with chlorhexidine	The average length of the intervention period was 15.6 months \pm SD 9.2 (range 4 – 36).	0 months	Definitions of the CDC/NHSN and INICC surveillance methods applied

Study #	Author	Year	Description of the intervention	WASH only/Combined	WASH intervention description	Length of the intervention	Length of post-intervention follow up	Definition of HCAI used
13	Leblebicioglu et al	2013	1- Bundle of infection control interventions 2- education, 3- outcome surveillance, 4- process surveillance, 5- feedback of CLAB rates, and 6- performance feedback on infection control practices.	Combined	Hand hygiene, disinfection of skin and equipment, oral care with antiseptic solution, observation of HH compliance	The average length of the intervention period was 28.64 months \pm SD 20.27 (range 6–72)	0 months	CDC NHSN definitions for VAP applied. VAP is diagnosed in a mechanically ventilated patient with a chest radiograph that shows new or progressive infiltrates, consolidation, cavitation, or pleural effusion. The patient also must meet at least one of the following criteria: new onset of purulent sputum or change in character of sputum, organism cultured from blood, or isolation of an etiologic agent from a specimen obtained by tracheal aspirate, bronchial brushing or bronchoalveolar lavage, or biopsy

Study #	Author	Year	Description of the intervention	WASH only/Combined	WASH intervention description	Length of the intervention	Length of post-intervention follow up	Definition of HCAI used
14	Lenz et al	2018	Monthly workshops were carried out on hand hygiene and the implementation of the five moments at the point of patient care	Combined	Workshops were carried out on hand hygiene and the implementation of the five moments at the point of patient care	10 months	0 months	Definition from the Centers for Disease Control and Prevention (CDC)

Study #	Author	Year	Description of the intervention	WASH only/Combined	WASH intervention description	Length of the intervention	Length of post-intervention follow up	Definition of HCAI used
15	Marra et al	2010	<p>Bundle included creation of a central catheter insertion cart; hand hygiene; maximal barrier precautions for insertion; chlorhexidine skin antiseptis; optimal catheter site selection, with avoidance of the femoral vein for central venous access in adult patients; daily review of line necessity with prompt removal of unnecessary lines)</p> <p>The ICU and SDU nurses intervened in this process at the same time that performance monitoring was occurring at the bedside if non-compliance with an element of the bundle was detected (eg, hand hygiene was not performed).</p>	Combined	Hand hygiene, disinfection of skin and equipment, monitoring of HH compliance	24 months	0 months	<p>CDC definition</p> <p>A CLABSI was considered to be related to a specific unit if detected at least 48 hours after admission to, or less than 48 hours after discharge from, the unit</p>

25	Von Dolinger de Brito et al	2007	HCAIs	N/R	Device utilization ratios for CVCs and ventilators	Cultures	The rate of HAI rose significantly from 12.8 to 18.6% ($P < 0.01$) after moving to the temporary unit, which had a lower sink:cot ratio and a higher monthly admission rate. In contrast, the rates of catheter associated staphylococcal bacteraemia decreased significantly after moving to the new NICU ($P < 0.0001$). Since peripherally inserted central catheters (PICCs) were introduced concomitantly with the move to the new unit, however, the catheter type may have contributed towards this reduction in CVC-related staphylococcal bacteraemias.
