

1

2 **ONLINE METHODS**

3 **Patients**

4 The two affected brothers were born to nonconsanguineous parents with no family
5 history of neurodevelopment disorders. Both patients were negative for FRA(X)
6 syndrome and chromosome microarray tests. The parents and the three female siblings
7 are healthy.

8 Patient 1 was born at term after caesarian section weighing 4,160 g. Examined at the
9 age of 34, presented at physical examination: height 1.81 m, weight 86 kg, hair whorls,
10 thick eyebrows (without synophris), large mouth, widely spaced nipples, normal
11 genitalia and shortened Achilles tendons. Temporal irritative focus was detected by
12 routine EEG at the age of 6, but without any convulsive or other epilepsy manifestations.
13 He presented mild intellectual disability, without significant delayed motor milestones,
14 but exhibited stuttering and difficulties in the articulation of words. He attends to a
15 special education school, having achieved a level equivalent to 3rd-4th degree of
16 elementary schooling.

17 Patient 2 was born at term after caesarian section weighing 3,890 g. Physical
18 examination at the age of 32 showed: height 1.71 m, weight 55 kg, moderate degree of
19 frontal balding, hair whorls, thick eyebrows (without synophris), large mouth, normal
20 genitalia. Similarly to his brother, he presented a mild intellectual disability; he did not
21 present significant delayed motor milestones, with pronounced difficulties in the

22 articulation of words. He also attends to a special education school, having achieved a
23 level equivalent to 3rd-4th degree of elementary schooling.

24 This study was approved by the ethics committee of the Institute of Biosciences
25 (University of São Paulo, São Paulo, Brazil), and written informed consent was obtained
26 from parents. The current work is in compliance with all relevant ethical regulations.

27

28 **Whole Exome Sequencing**

29 DNA samples were prepared using the AmpliSeq Exome library, according to the
30 manufacturer's specifications. The AmpliSeq libraries were single-end sequenced on an
31 Ion Proton™ System at Beijing Genomics Institute (BGI, Beijing, China). The raw reads
32 were aligned to the reference genome (GRCh37/hg19), using BWA⁵¹, and pre-processed
33 according to GATK toolkit⁵². Filtering and prioritization of variants were conducted using
34 VarSeq® software (Golden Helix, Bozeman, MT, USA). The variants were filtered per
35 population frequency (<0.01), quality (phred quality ≥ 20 , genotype quality ≥ 20), read
36 depth (≥ 10).

37

38 **Sanger Sequencing**

39 Sanger sequencing was used to confirm the presence of the variants considered
40 potentially pathogenic and segregation studies (primer sequences available upon
41 request).

42

43 **X-inactivation analysis**

44 X-inactivation tested by determining the methylation status of the androgen receptor
45 gene (AR) was evaluated as described previously⁵³.

46

47 **Cloning and mutagenesis**

48 The wild-type UBE2A gene and Q93E mutant were amplified by PCR from mother's
49 patients and index cDNA, respectively, and cloned into pET28a vector (Novagen), using
50 NdeI and XhoI restriction sites. Human PCNA gene was also inserted into pET28a vector
51 using the same restriction sites. Human RAD18 was cloned into the restriction sites
52 BamHI e XhoI of a modified version of pETSUMO (Invitrogen). Expression plasmids for
53 human Uba1 and Ub (both in pET3a) were donated by Drs. Titia Sixma and Chris Hill,
54 Addgene plasmids #63571 and #61937, respectively. All point mutations in UBE2A
55 (Q93E, Q93A, Q93R, C88S, C88S/Q93E, R7W, R11Q, G23R) were created using basic
56 PCR-based site-directed mutagenesis and confirmed by Sanger sequencing.

57

58 **Protein expression and purification**

59 Wild-type UBE2A (residues 1-152) and mutants (Q93E, Q93A, Q93R, C88S, C88S/Q93E,
60 R7W, R11Q, G23R) were expressed from pET28a (Novagen) as an N-terminal His6-tag
61 fusion. Rosetta II E. coli cells (Novagen) were used to express the proteins in LB media
62 at 37°C for 5 hours at 200 rpm. The culture temperature was turned down to 18 °C for
63 1 hour before induction with 0.2 mM IPTG (isopropyl β -D-1-thiogalactopyranoside)

64 and cells were grown at 18°C for 16 h, then harvested by centrifugation (5,000 × g for
65 10 min at 4 °C). Cells were disrupted by sonication in lysis buffer (50 mM Tris pH 7.5,
66 300 mM NaCl, 10% glycerol, 2 mM β-mercaptoethanol and 1 mM phenylmethylsulfonyl
67 fluoride) containing 0.2 mg/mL lysozyme and centrifuged to remove cellular debris (40
68 000 x g for 60 min at 4 °C). Proteins were first purified on a HisTrap column (GE
69 Healthcare) pre-equilibrated with binding buffer containing 50 mM Tris pH 7.5, 300
70 mM NaCl, 2 mM β-mercaptoethanol and eluted using a linear gradient of same buffer
71 containing 500 mM imidazole, in an AKTA Purifier system (GE Healthcare). The His6-
72 tag was cleaved by thrombin protease and the proteins were further purified by a
73 Superdex 75 column (GE Healthcare) with buffer containing 50 mM Tris pH 7.5, 300
74 mM NaCl, 1 mM dithiothreitol. After concentration to 10 mg/ml, proteins were flash-
75 frozen in liquid nitrogen and stored at -80°C. Recombinant purified UBE2A proteins
76 are shown in Supplementary Figure 12. Human Uba1, Ub, SUMO-RAD18 and PCNA were
77 expressed and purified as previously described^{21,54,55}.

78

79 **Crystal Structure Determination**

80 Crystals were obtained by sitting-drop vapor diffusion at 18°C mixing equal volumes of
81 protein at 10 mg/mL and the reservoir solution containing 50 mM di-Sodium succinate
82 pH 7.0 and 12-14% PEG 3350. Harvested crystals were cryoprotected with 10%
83 ethylene glycol added to the mother liquor (v/v). Data were collected at 1.46 Å at the
84 beamline W01B-MX2 (LNLS) at 100 K, processed using XDS⁵⁶ and merged and scaled
85 with Aimless⁵⁷. The structures were solved by molecular replacement using MolRep⁵⁷.

86 The human UBE2B protein (PDB ID code 2YB6)²¹ was used as search model for WT
87 UBE2A, which structure was used as search model for Q93E mutant. The models were
88 refined using Phenix program (phenix.refine)⁵⁸ and the quality of the final models was
89 assessed with MolProbity. The crystallographic parameters and final refinement
90 statistics are summarized in Supplementary Table 1. Both final models contained
91 97.3% of residues in favored regions and 2.7% in allowed regions of the Ramachandran
92 plot (no outliers).

93

94 **NMR spectroscopy**

95 ¹⁵N-labeled WT- and Q93E-UBE2A proteins were produced in M9 minimal media
96 supplemented with 1 g/L ¹⁵NH₄Cl (Cambridge Isotope Laboratories). To produce
97 ¹³C/¹⁵N-labeled Q93E-UBE2A the M9 was also supplemented with 4 g/L [¹³C₆]-D(+)-
98 glucose (Cambridge Isotope Laboratories). The expression and purification protocols
99 were performed as described for the unlabeled proteins. The gel filtration final buffer
100 contained 50 mM K₂HPO₄-KH₂PO₄ (pH 8.0), 200 mM NaCl, 1 mM DTT. Labeled proteins
101 were concentrated to 750 μM and 10% D₂O was added. NMR spectra were recorded at
102 25^oC on an Agilent Inova 500-MHz spectrometer. The spectra were processed with
103 NMRPipe/NMRDraw⁵⁹ and analyzed with NMRView⁶⁰. The backbone assignment of
104 Q93E-UBE2A was determined using the three-dimensional experiments HNCACB,
105 CBCA(CO)NH, HNCO, and HN(CA)CO and the graphical interface Smartnotebook.

106

107 **NMR Thioester and Oxyester Reactions**

108 Thioester reaction was performed in the NMR tube (in 200 μ L) using 60 μ M 15 N-UBE2A,
109 180 μ M ubiquitin and 3 μ M Uba1 in buffer containing 50 mM Tris pH 8.0, 150 mM NaCl,
110 5 mM MgCl₂, 0.5 mM DTT. For oxyester reactions, 400 μ M 15 N-C88S-UBE2A or 15 N-
111 C88S/Q93E-UBE2A was mixed with 650 μ M ubiquitin and 6 μ M Uba1, or conversely,
112 200 μ M 15 N-Ub was put together with 325 μ M C88S-UBE2A or C88S/Q93E-UBE2A and
113 3 μ M Uba1, in the same buffer used for thioester reaction. All reactions were conducted
114 at 30°C and started with addition of 10 mM ATP. Sequential (1 H, 15 N)-HSQC spectra were
115 acquired on a 600-MHz spectrometer (Agilent Inova) equipped with a cryogenic probe.
116 We used the backbone resonance assignment of apo ubiquitin available on BMRB (code
117 4769).

118

119 ***In vitro* Ubiquitination Assay**

120 Ubiquitination assays were performed at 32°C using 1 μ M human recombinant Uba1,
121 30 μ M human recombinant ubiquitin and 20 μ M WT- or Q93E-UBE2A in the
122 ubiquitination buffer: 50 mM Tris pH 8.0, 50 mM NaCl, 50 mM KCl, 10 mM MgCl₂, 0.1
123 mM DTT. Reactions were started by addition of 3 mM ATP and quenched with an equal
124 volume of 2X SDS-PAGE buffer (reducing or non-reducing). Samples collected in specific
125 time points were resolved by SDS-PAGE followed by Western blot using anti-ubiquitin
126 antibody (P4D1 - Santa Cruz). *In vitro* ubiquitination assay in different pHs were
127 conducted identically to described above replacing the buffer: sodium acetate for pH 5,
128 MES for pH 6, Tris for pH 7-9 and Caps for pH 10-11. For intrinsic reactivity assays, WT-
129 and Q93E-UBE2A were charged for 15 minutes at 32°C in ubiquitination buffer before

130 being mixed with 10 mM EDTA and 25 mM of lysine or 5 mM hydroxylamine, and
131 incubated at 32°C. Samples were collected at several time points during the reaction,
132 quenched in non-reducing SDS-PAGE buffer and visualized by Coomassie stained SDS-
133 PAGE. PCNA mono-ubiquitination was performed by mixing 1 μM Uba1, 30 μM
134 ubiquitin, 20 μM WT- or Q93E-UBE2A, 5 μM SUMO-Rad18 and 1 μM PCNA in the
135 ubiquitination buffer supplemented with 2 μM ZnCl₂ and incubated at 32°C in the
136 presence of 3 mM ATP, followed by anti-PCNA (P8825 - Sigma) Western blot.

137

138 **Single-turnover diubiquitin formation assay**

139 Diubiquitin formation assay was conducted in a two-step reaction. First, charging of
140 UBE2A was achieved by mixing 20 μM of WT- or Q93E-UBE2A with 1 μM E1, 30 μM
141 lysine-free ubiquitin (K0-Ub) and 3 mM ATP in the ubiquitination buffer (pH 8). After
142 incubation for 15 minutes at 37 °C, reaction was stopped by addition of 25 mM EDTA
143 and then diluted four times in ubiquitination buffer at pH 8 or 9 (both using 50 mM
144 Tris-HCl), resulting in final concentrations of 0,25 μM E1, 5 μM UBE2A and 7,5 μM
145 lysine-free ubiquitin. Di-ubiquitin formation was triggered by addition of 7,5 μM WT-
146 ubiquitin. Reactions were kept at 32°C, samples were collect at different timepoints and
147 immediately quenched in reducing SDS-PAGE buffer. Results were evaluated by
148 western blot using anti-ubiquitin antibody (P4D1 - Santa Cruz), followed by
149 quantification of corresponding di-ubiquitin band with ImageJ.

150

151 **Molecular Modeling**

152 UBE2A was covalently bound to ubiquitin using as template the UBE2N~Ub structure
153 (PDB ID code 5aiu)³⁰. UBE2A was superposed to UBE2N and the complex formed by
154 UBE2A and ubiquitin was submitted to energy minimization using steepest descent
155 followed by simulated annealing protocol (SD/SA) to remove bad contacts, fixing
156 backbone atoms of UBE2A and ubiquitin. Following, we created the thioester bond
157 between the carboxyl group of the terminal glycine residue of ubiquitin and the
158 sulfhydryl group of catalytic Cys88 of UBE2A. To correct the bond angle and length, a
159 new round of energy minimization using SD/SA was performed, fixing the backbone
160 atoms of Cys88. All steps were performed using YASARA software and the AMBER03
161 force field. To position a second free-ubiquitin molecule with a lysine positioned to
162 attack the thioester bond, we used the template of Mms2-Ubc13 covalently bound to
163 ubiquitin and presenting the Lys63 residue from another symmetric lysine positioned
164 close to the thioester bond (PDB ID code 2gmi)³⁷, when applied the symmetry
165 operators of P2₁2₁2₁ space group using Pymol. We superposed UBE2A to Ubc13 to
166 position the second ubiquitin generated by symmetry close to thioester bond. Then,
167 the backbone atoms of UBE2A~Ub was fixated and an energy minimization using
168 SD/SA was carried out to eliminate bad contacts.

169

170 **Statistical analysis**

171 Crystallographic statistics are indicated in Supplementary Table 1. All western blot
172 experiments were repeated independently three times with similar results. (¹H,¹⁵N)-
173 HSQC spectra of UBE2A proteins (WT, Q93E, C88S, C88S/Q93E) were

174 repeated independently at least two times with similar results. Each oxyester and
175 thioester reaction and subsequent NMR data collection was performed once. Data
176 from discharge assays, diubiquitin formation and PCNA monoubiquitination assays
177 were derived from three independent experiments and are presented as the
178 mean \pm standard deviation. The diubiquitin production rates were determined from a
179 linear regression. The PCNA monoubiquitination formation data were fitted according
180 to the equation: $PCNA-Ub = Plateau(1 - e^{-Kt})$, where PCNA-Ub is the fraction of
181 monoubiquitinated PCNA, Plateau is the PCNA-Ub value at infinite times, K is the rate
182 constant, t is time, and $t_{1/2} = \ln(2)/K$.

183

184 **DATA AVAILABILITY**

185

186 The atomic coordinates and structure factors have been deposited in the Protein Data
187 Bank under accession codes 6CYO (WT-UBE2A) and 6CYR (Q93-UBE2A).
