Supplemental Figures

Supplemental Figure 1 Statistical validation of diagnostic cavernous angioma with symptomatic hemorrhage (CASH) biomarker **(A)** The receiver operating characteristic (ROC) analysis of the simulated cohort generated using Monte-Carlo approach showed 89% sensitivity and 67% specificity ($AUC=84\%$, $p<0.0001$) to differentiate CASH patients. **(B)** The same ROC analysis of the simulated cohort generated with a repetitive random-sampling validation demonstrated 80% sensitivity and 77% specificity ($AUC=82\%$, $p<0.0001$).

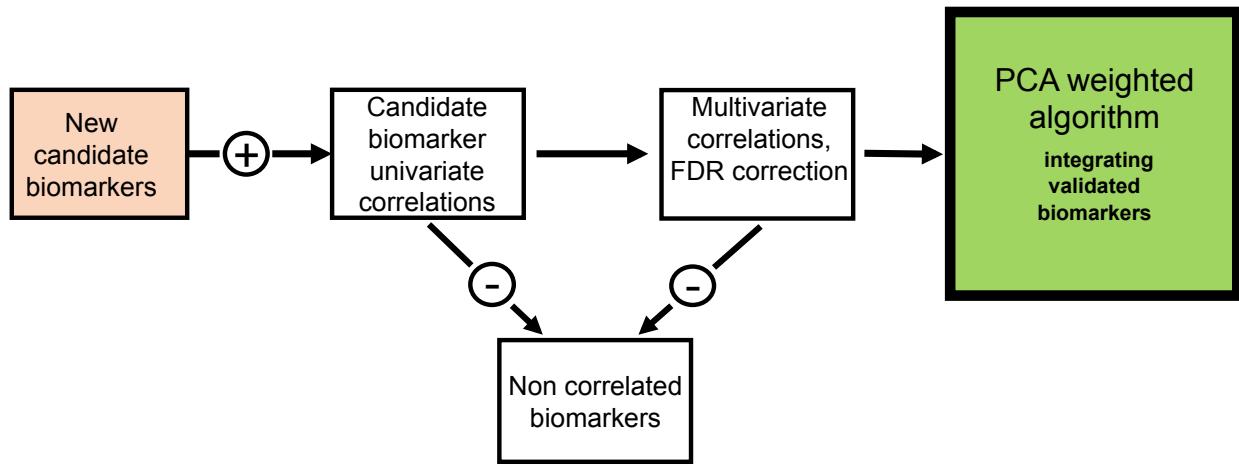

Supplemental Figure 2 Validation of the prognostic biomarker in an extended cohort of 77 cavernous angioma patients (A) A 2 tailed two-sample t-test showed that patients that experienced a hemorrhagic expansion within a year (± 30 days) after blood collection (mean estimated value \pm SD= -0.61 ± 0.68) had higher canonical values than patients that did not experience a subsequent cavernous angioma with symptomatic hemorrhage (CASH) (mean canonical value \pm SD= -2.00 ± 0.55 , $p<0.0001$). In addition, a trend toward lower canonical values ($p=0.10$) was observed in healthy subjects (mean canonical values= -1.01 ± 0.32) compared to patients that experienced a hemorrhagic expansion within a year (± 30 days). Finally, patients that did not experience a subsequent CASH (mean canonical value= -2.00 ± 0.07) had a lower mean canonical value in comparison to healthy subjects (mean canonical values= -1.00 ± 0.32 $p<0.0001$). (B) The ROC curve analysis showed 83% sensitivity and 93% specificity (AUC=94%, $p<0.0001$) to predict subsequent hemorrhagic expansion within the year following blood collection (± 30 days). *** $p<0.001$. Data represent mean \pm SEM.

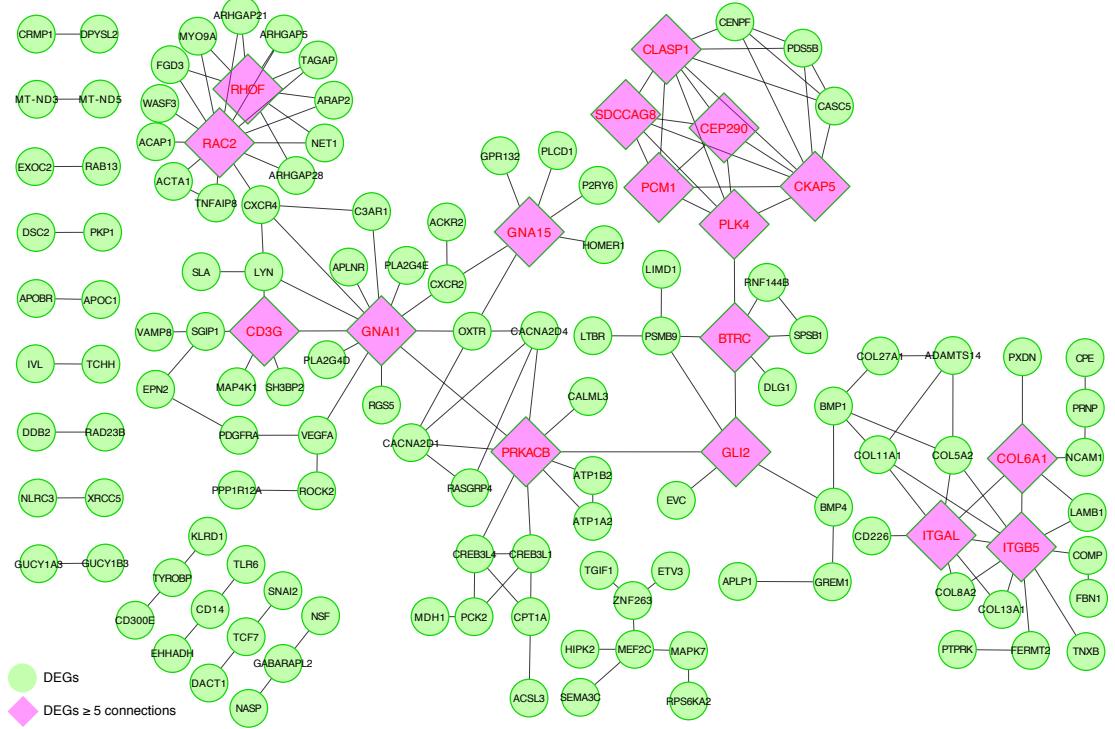

Supplemental Figure 3 *Cross-comparison of diagnostic and prognostic cavernous angioma with symptomatic hemorrhage (CASH) biomarkers* **(A)** The canonical values estimated with the prognostic biomarker were not significantly different in CASH patients ($n=18$; mean estimated value \pm SD= -0.38 ± 0.89) and those who were not ($n=39$; mean estimated value= -0.13 ± 4.5). **(B)** The receiver operating characteristic (ROC) analysis was not able to differentiate patients who experienced CASH (50% sensitivity, 86% specificity, AUC=62%, $p=0.03$). **(C)** The estimated canonical values calculated using the CASH biomarker ($n=16$; mean estimated value \pm SD= -1.45 ± 1.3) were higher ($p=0.03$) in patients that experienced a subsequent hemorrhagic expansion

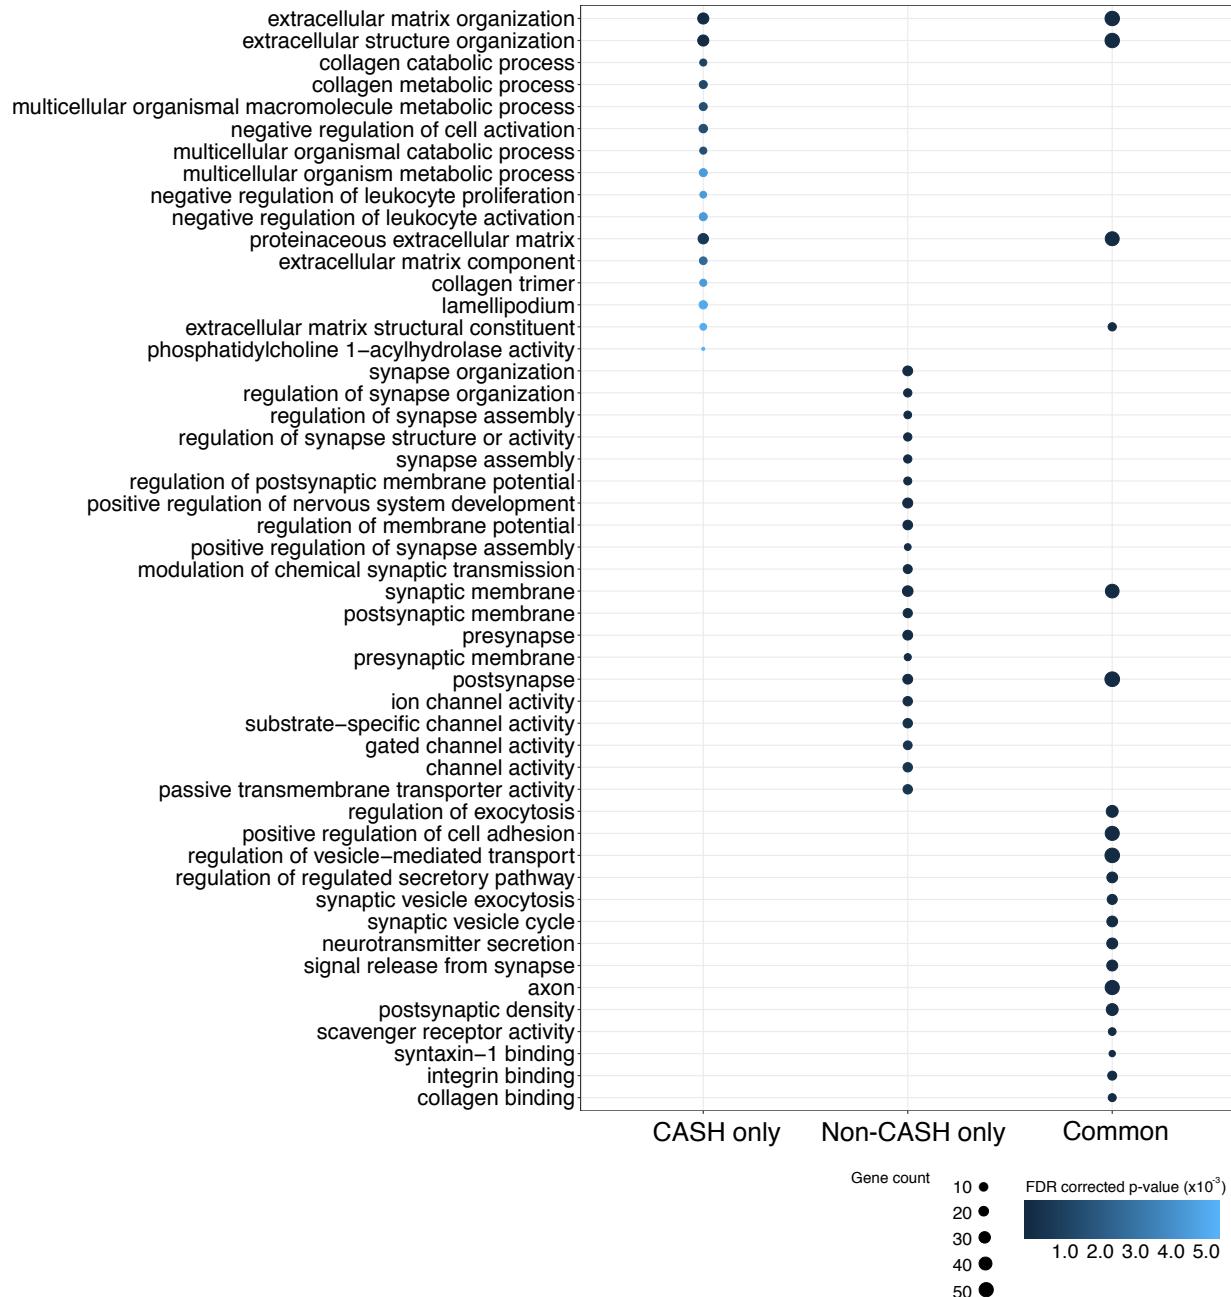

in the year (± 30 days) following the blood collection. (D) However, the ROC analysis was not able to differentiate patients well with future hemorrhagic expansion (50% sensitivity, 93% specificity, AUC=60%, $p=0.01$). The difference between canonical values estimated with the prognostic and diagnostic biomarkers were assessed using a two-sample t-test showed. Data represent mean \pm SEM. * $p<0.05$

Supplemental Figure 4 *Bayesian approach to study candidate molecules* Mechanistic targets and differential transcriptomic studies suggest candidate molecules. These candidate molecules are then analyzed for both diagnostic and prognostic clinical behavior in relation to cavernous angioma (CA) disease. The candidate molecules showing clinical associations with CA disease are then integrated in a weighted clustering degree algorithm to test if they improve the biomarkers. The candidate molecule showing no association with CA disease clinical features are discarded. PCA, principal component analysis.

Supplemental Figure 5 Network analysis of the 398 DEGs only identified in the cavernous angioma with symptomatic hemorrhage (CASH) transcriptome Among the 398 differentially expressed genes ($p < 0.05$ FDR corrected) 17 were highly interconnected (five or more connections) including *BTRC*, *COL6A1* and *ITGB5*. Previously document roles of some of these molecules include TLR4 signaling, apoptosis, and membrane stability. These transcriptomic analyses allow for future studies on highly interconnected genes by analyzing their function specifically in CASH pathogenesis, possible role as a biomarker, or therapeutic targeting following future study.

Supplemental Figure 6 *Top enriched gene ontology (GO) analysis* The GO analysis identified 28 enriched GO terms from the 398 DEGs only found in the CASH transcriptome, 44 enriched GO terms from the 237 differentially expressed genes (DEGs) only found in the non-CASH transcriptome, and 460 enriched GO terms from the common 629 DEGs found in the CASH and non-CASH transcriptome. Demonstrated in the above figure are the top enriched GO terms by p-

value, with a representation of the top ten GO terms for biological processes, top five for molecular function, and top three for cellular component for each group of DEGs ($p < 0.01$, FDR corrected).
