* contiguous combination

[#] *in silico* experiments performed with 84,711 full length sequences from the RDP database which contained all nine V-regions.

(primer specificity evaluated while allowing a maximum mismatch of 2 base pairs)

Result of similar *in silico* experiments for assessing primer specificity performed with all sequences from RDP are presented in Supplementary Table S8.

(B) A comparison of taxonomic profiling accuracy obtained with V1+V5 paired-end reads generated in the *in silico* experiments with respect to those which may be obtained by using 68F-908R primers (currently available for 16S rRNA amplicon sequencing). Results pertaining to simulated host (human) associated microbiomes (as presented in Figure 5) are depicted.
