A. CD9 and CD63 cDNA PCR

Supplementary Figure 1S. DSP1-CD9/CD63 fusion constructs design. A. CD9 and CD63 human cDNA sequences were amplified by PCR using specific oligonucleotides (C). Tetraspanin full coding sequence (CD9 or CD63) was inserted in reading frame after DSP1 C-terminus (B). The fusion protein constructs, as well as DSP1 and DSP2 were amplified by PCR for subsequent cloning into two different vectors (D and E). D. DSP1-CD9/CD63 subcloning into pcDNA 3.3-TOPO vector allows for direct cell transfection. E. Subcloning into PCR 2.1-TOPO vector provided EcoR1 restriction sites for the final subcloning into pLVX-PURO lentiviral vector. HEK293 cells were transfected with pLVX-Puro vectors to produce lentiviral particles for viral transduction of cells with DSP1, DSP1-CD9/CD63 and DSP2.
