

# Supplementary Figure 7

**Supplementary figure 7: Insulin induced EMT blocked by IR knockdown.** Expression of FOXC2 and other mesenchymal markers following insulin (Ins, 10nM) +/- DHT (10nM) treatment using 5-day doxycycline (250ng/mL/day) induced shINSR3 cells. Insulin-induced increases are muted with shINSR induction. DHT inhibits insulin-induction. PSA control for DHT response. (n=3, \*\*p<0.01, \*\*\*p<0.001, One-way ANOVA, ± SEM)
