

Supplementary methods

Table S1. Primers used in RT-qPCR

Gene	Primer sequence (5'-3')	Product size (bp)
SOX2	Forward TGGACAGTTACGCGCACAT Reverse CGAGTAGGACATGCTGTAGGT	215
REX1	Forward GCCTTATGTGATGGCTATGTGT Reverse ACCCCTTATGACGCATTCTATGT	96
OCT4	Forward CGAGAAGGATGTGGTCCGAG Reverse CAGAGGAAAGGACACTGGTC	136
NANOG	Forward AGATGCCAACACGGAGACT Reverse GTTGCCCTTGGGACTGGTG	96
TNNT2	Forward CATGGAGAAGGACCTGAATGA Reverse CGTCTCTCGATCCTGTCTTG	108
MYH6	Forward CCACCCAAGTTGACAAGAT Reverse CACAGAAAGGGCCCAGTAG	127
NKX2-5	Forward CAAGTGTGCGTCTGCCCTT Reverse GCCCACAGCTTTCTTTTC	105
GATA4	Forward TGGCCTGTCATCTCACTACG Reverse TAGCCTTGTGGGAGAGCTT	126
TBX5	Forward CAGACTCGGCACAGCGGCAA Reverse GTGGGGAGCCATGGTGGCC	237
DES	Forward CTGAGCAAAGGGTTCTGAG Reverse ACTTCATGCTGCTGCTGT	109
GAPDH	Forward AGTCCCTGCCACACTCAG Reverse TACTTATTGATGGTACATGACAAGG	123
SCN5A	Forward TCATCGTAGACGTCTCTGGT Reverse GGCTCTTGTGTTACGATGGT	318
CACNA1D	Forward GGGCAATGGGACCTCATAAATAA Reverse TTACCTGGTGGCGACTGCATTA	141
KCNJ12	Forward GCCAGCTAGGCTCTGTTGT Reverse CTGAGACACATCTAAGGTAC	152
KCND3	Forward AGAGAGCTGATAAACCGAGGG Reverse CAGGCAGTGCAGCAGGTGAT	209
HCN2	Forward CGCCTGATCCGCTACATCCAT Reverse AGTGCAGAAGGAGTACAGTTACT	230
PPARGC1A	Forward GCAATTGAAGAGGCCGTGTA Reverse CTGTCTCCATCATCCCGCAGAT	134
NRF1	Forward AGGCTGGGGAAAGAAAG Reverse CCAACCTGGATAAGTGAGAC	303
HIF1A	Forward CCAACAGTAACCAACCTCAG Reverse TCCTGTGGTGACTTGTCCCTT	302

Extracellular Flux analysis

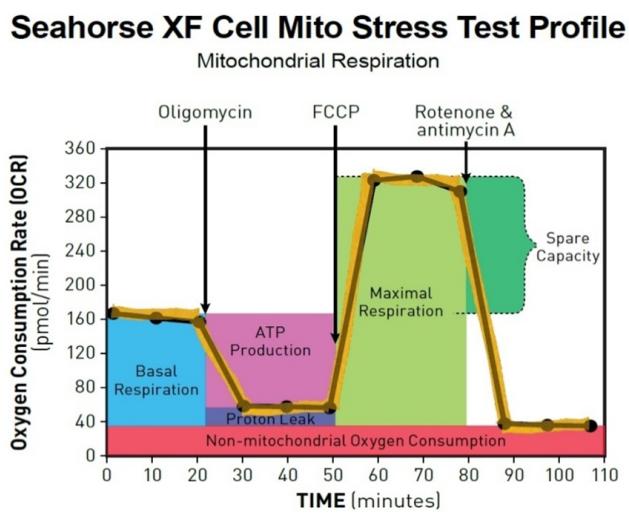

Extracellular Flux analysis was done using Seahorse XFp Extracellular Flux analyzer, Cell Mito Stress Test Kit and Cell Energy Phenotype Test Kit (Agilent Technologies, USA). The device simultaneously detects changes in oxygen concentration and in proton concentration (or pH) in the assay medium.

Cell Energy Phenotype Test Kit measures the basal oxygen consumption rate (OCR) and then OCR after the injection of the stressor mix ($1 \mu\text{M}$ of Oligomycin and $1 \mu\text{M}$ of FCCP). Oligomycin inhibits ATP production by the mitochondria and causes a compensatory increase in the rate of glycolysis as the cells attempt to meet their energy demands via the glycolytic pathway. FCCP depolarizes the mitochondrial membrane and drives OCR higher as the mitochondria attempt to restore the mitochondrial membrane potential. The main parameters are as follows:

- Oxygen consumption rate (OCR): The rate of decrease of oxygen concentration in the assay medium. OCR is a measure of the rate of mitochondrial respiration of the cells.
- Extracellular acidification rate (ECAR): The rate of increase in proton concentration (or decrease in pH) in the assay medium. ECAR is a measure of the rate of glycolysis of the cells.
- Baseline phenotype: OCR and ECAR of cells at starting assay conditions.
- Stressed phenotype: OCR and ECAR of cells in the presence of stressor compounds.
- Metabolic potential: Percentage increase of stressed OCR over baseline OCR and stressed ECAR over baseline ECAR. Metabolic potential is the measure of cells' ability to meet the energy demand via respiration and glycolysis.

Cell Mito Stress Test Kit measures mitochondrial function in the cell by detecting OCR at the baseline level and after the addition of electron transfer chain (ETC) modulators: Oligomycin inhibits ATP synthase (complex V) and the decrease in OCR following injection of Oligomycin correlates to the mitochondrial respiration associated with cellular ATP production. Carbonyl cyanide-4 (trifluoromethoxy) phenylhydrazone (FCCP) is an uncoupling agent that collapses the proton gradient and disrupts the mitochondrial membrane potential. As a result, electron flow through the ETC is uninhibited and oxygen is maximally consumed by complex IV. The third injection is a mix of Rotenone, a complex I inhibitor, and Antimycin A, a complex III inhibitor. This combination shuts down mitochondrial respiration and enables the calculation of non-mitochondrial respiration driven by processes outside the mitochondria.

The exemplary profile of Cell Mito Stress Test (from the user manual):

The main parameters are as follows:

- Basal respiration: Oxygen consumption used to meet cellular ATP demand and resulting from mitochondrial proton leak. Calculated as (Last measurement before the first injection) – (Non-mitochondrial respiration rate).
- ATP Production: The decrease in oxygen consumption rate upon injection of Oligomycin represents the portion of basal respiration that was being used to drive ATP production. Shows ATP produced by the mitochondria that contributes to meeting the energy needs of the cell. Calculated as (Last rate measurement before Oligomycin in-

jection) – (Minimum rate measurement after Oligomycin injection).

- H⁺ (Proton) leak: Remaining basal respiration not coupled to ATP production. Proton leak can be a sign of mitochondrial damage or can be used as a mechanism to regulate the mitochondrial ATP production. Calculated as (Minimum rate measurement after Oligomycin injection) – (Non-mitochondrial respiration).
- Maximal respiration: The maximal oxygen consumption rate attained by adding the uncoupler FCCP. FCCP mimics a physiological “energy demand” by stimulating the respiratory chain to operate at maximum capacity, which causes rapid oxidation of substrates to meet this metabolic challenge. Shows the maximum rate of respiration that the cell can achieve. Calculated as (Maximum rate measurement after FCCP injection) – (Non-mitochondrial respiration).
- Spare respiratory capacity: This measurement indicates the capability of the cell to respond to an energetic demand as well as how closely the cell is to respire to its theoretical maximum. The cell's ability to respond to demand can be an indicator of cell fitness or flexibility. Calculated as (Maximal respiration) – (Basal respiration).
- Nonmitochondrial respiration: Oxygen consumption that persists due to a subset of cellular enzymes continuing to consume oxygen after Rotenone and Antimycin A addition. This is important for getting an accurate measure of mitochondrial respiration. Calculated as the minimum rate measurement after Rotenone/Antimycin A injection.
