

Cell Reports, Volume 27

Supplemental Information

β Cell Hypoxia-Inducible Factor-1 α Is Required for the Prevention of Type 1 Diabetes

Amit Lalwani, Joanna Warren, David Liuwantara, Wayne J. Hawthorne, Philip J. O'Connell, Frank J. Gonzalez, Rebecca A. Stokes, Jennifer Chen, D. Ross Laybutt, Maria E. Craig, Michael M. Swarbrick, Cecile King, and Jenny E. Gunton

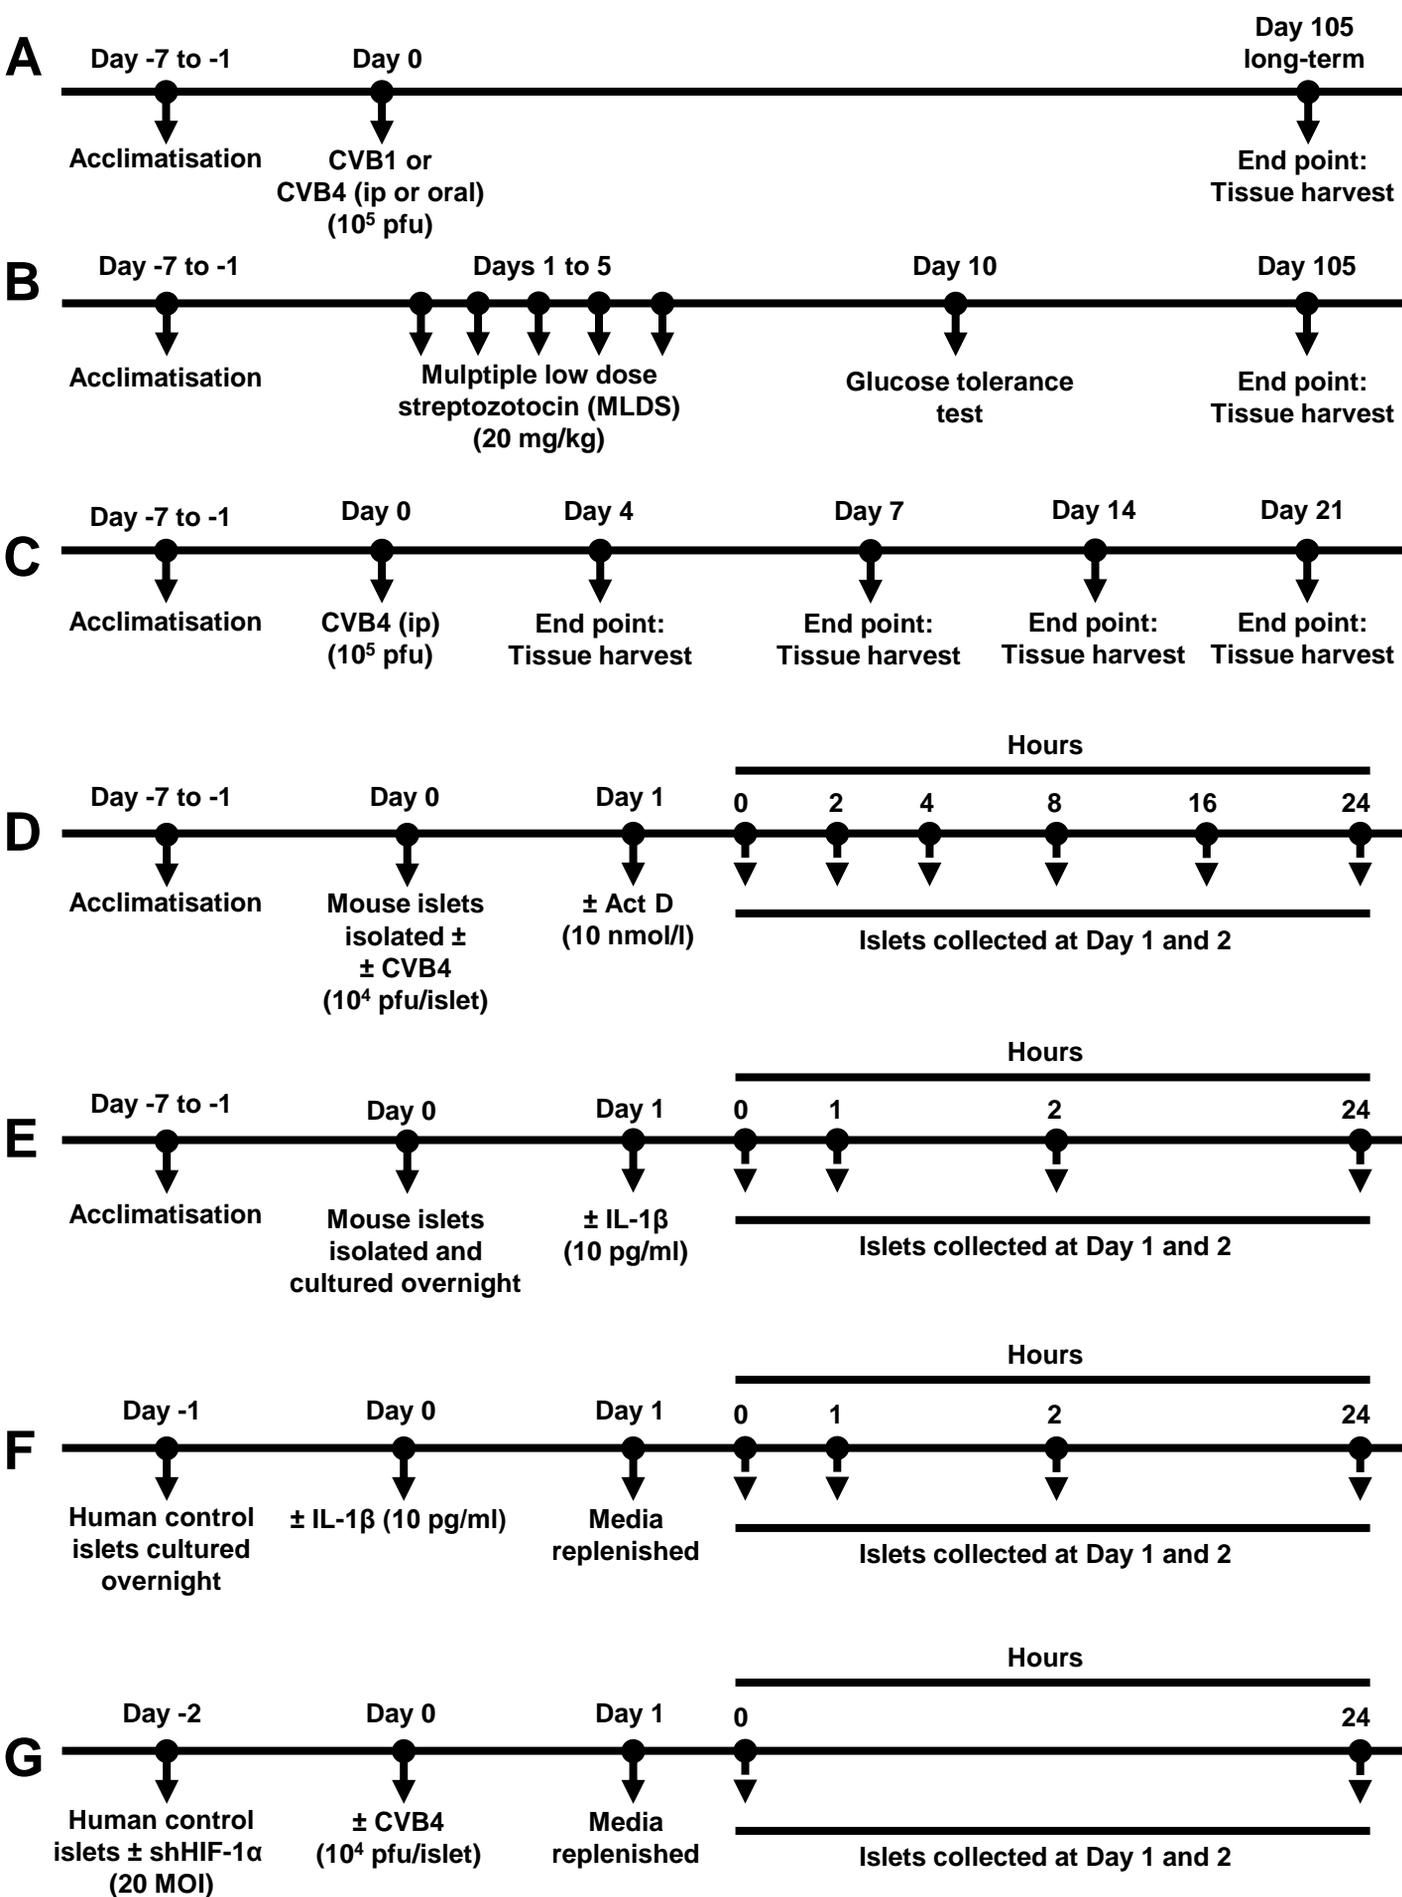

Supplementary Figure 1. Related to Figure 1, Star Methods Experimental Model and Subject Details.

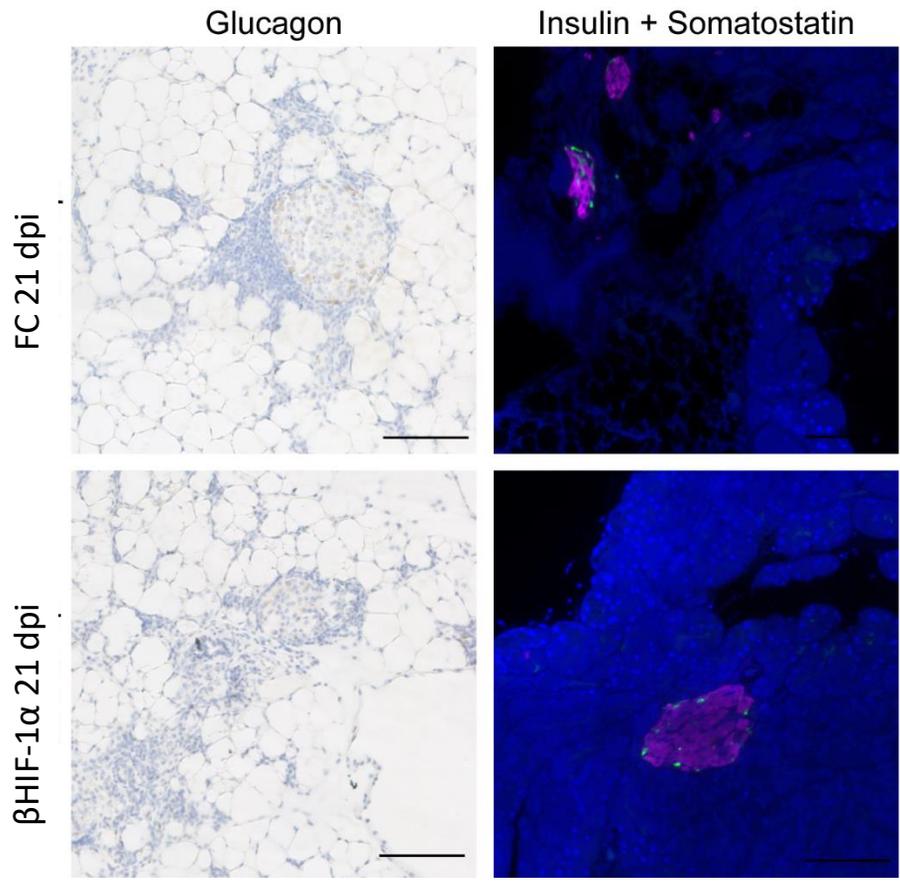

A) Baseline islet architecture appears normal in β HIF-1 α mice. Scale bar indicates 100 μ m. Glucagon positive cells are stained brown. Somatostatin positive cells are green, and insulin positive cells are pink.

B) Baseline insulinitis scores at 8 weeks of age in 8-week old floxed control (FC) and β HIF-1 α mice. **= $p < 0.01$ versus FC.

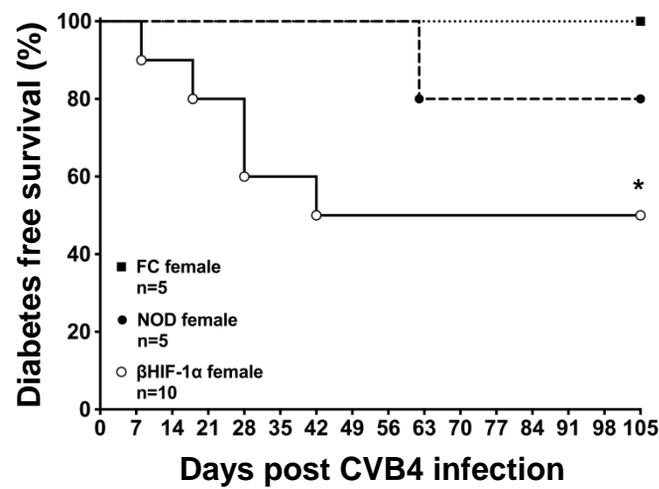

C) Images of plaque assays of pancreatic tissue from FC and β HIF-1 α mice. No plaques were detected at day 21.

Supplementary Figure 2. Experimental timelines. Relates to Figures 1, 2 and 6. Pfu= particle forming units. Act D = actinomycin D. MOI = multiplicity of infection.

Supplementary Figure 3. Relates to Figure 3. Islet histology at 21 days after CVB4 infection. The scale bars indicate 100 μ m. Glucagon is shown in brown in the left panels. In the right panels insulin is in pink and somatostatin positive cells are in green.

A**Supplementary Figure 4. Relates to Figure 1.**

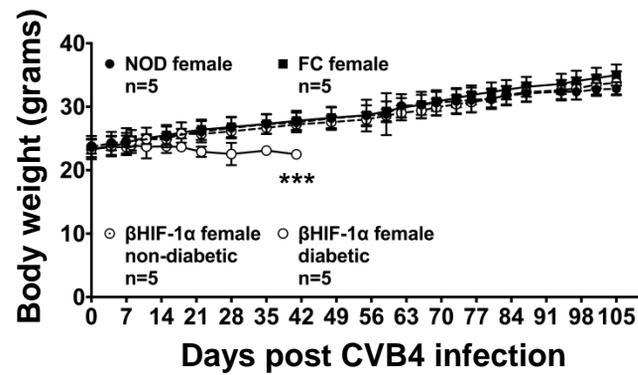

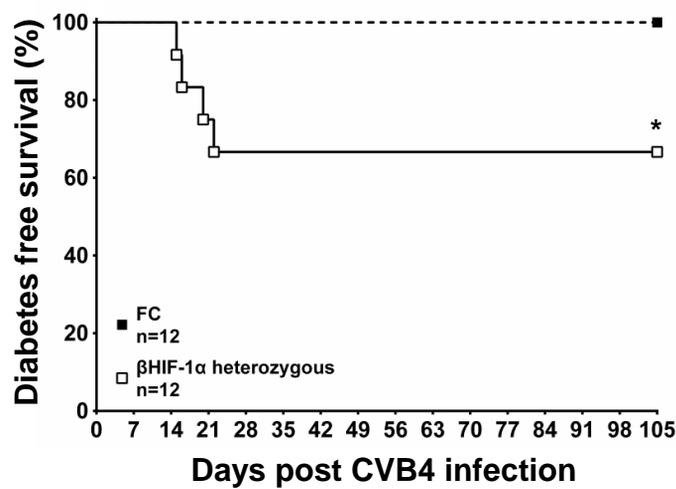

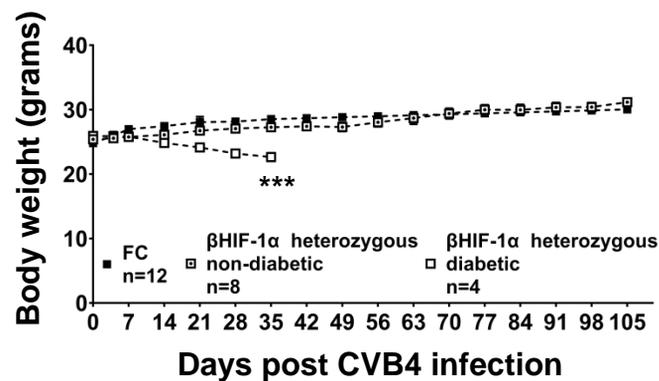

A) Diabetes-free survival in female mice which were infected with CVB4 at 8 weeks of age.

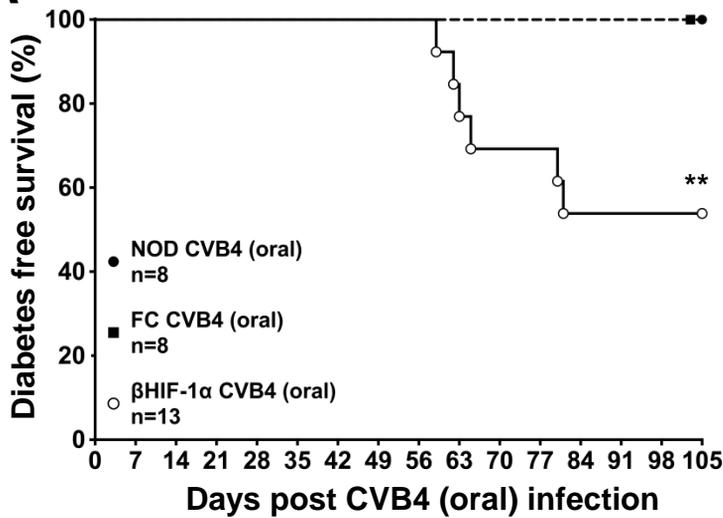

*=p<0.05 compared to controls.

B) Body weight in the same female mice shown in part A). ***=p<0.001 versus controls.

C) Diabetes free survival in male heterozygous βHIF-1α mice compared to floxed controls (FC) infected with CVB4 at 8 weeks of age. *=p<0.05 compared to floxed controls.

D) Body weight in the same male mice shown in part C). ***=p<0.001 versus controls.

B**C****D**

A

Supplementary Figure 5. Relates to STAR METHODS – METHODS.

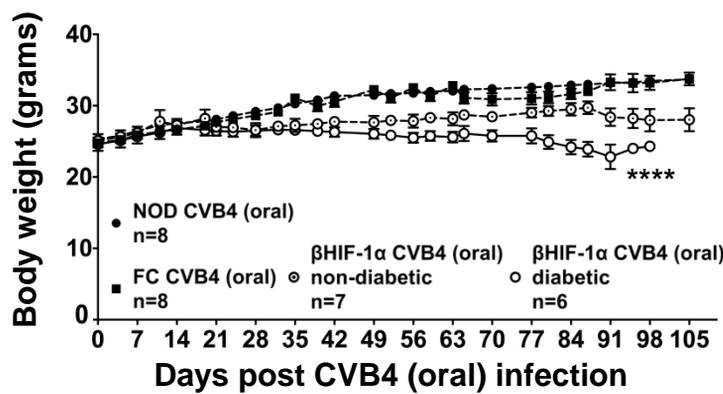

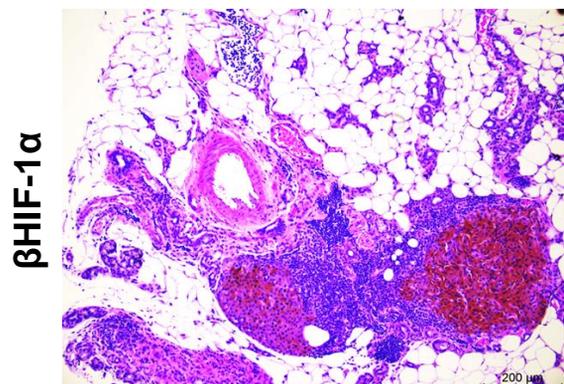

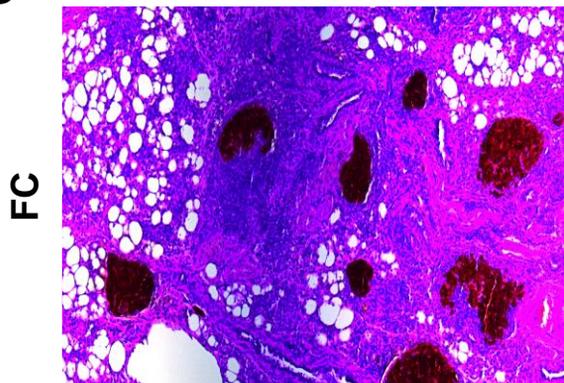

A) Diabetes-free survival after oral gavage with CVB4. **= $p < 0.01$ versus controls.

B) Body weight curves in mice from A).

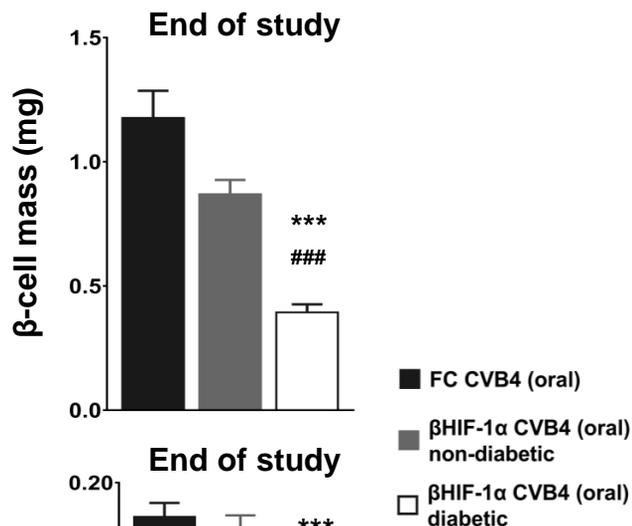

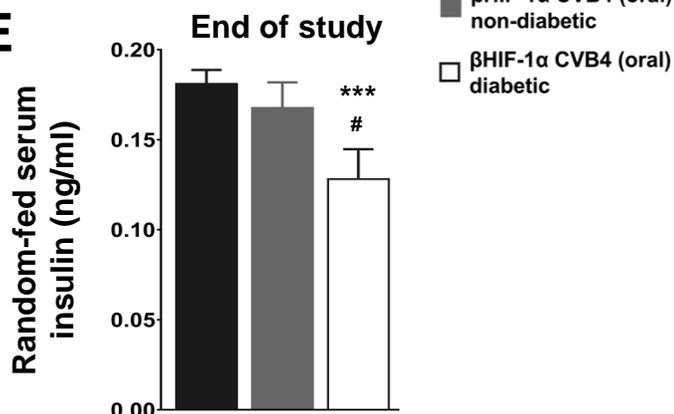

C) Insulin immunohistochemistry with H&E counterstain at end of study in orally gavaged mice.

D) β -cell mass at the end of study. *** $p < 0.001$ vs FC. ### $p < 0.001$ vs non-diabetic β HIF-1 α mice.

E) Random-fed serum insulin at the end of study. *** $p < 0.001$ vs FC. # $p < 0.05$ vs non-diabetic β HIF-1 α mice.

B**C**

Insulin and H&E (end of study)

D**E**

Supplementary Table 1: Flow cytometry antibodies (arranged alphabetically). Relates to Star Methods; Methods – isolation of infiltrates.

Antibody	Fluorochrome	Clone	Catalog number	Supplier
CD11b	AF488	M1/70	557672	BD Biosciences
