

Supplementary Material: *Three decades of heat stress exposure in Caribbean coral reefs: a new regional delineation to enhance conservation.*

AI Muñoz-Castillo, A Rivera-Sosa, I Chollett, CM Eakin, L Andrade-Gómez,
MD McField and JE Arias-González.

Supplementary Table 1. Descriptive statistics of maximum Degree Heating Weeks (DHW) values from 1985 to 2017 by ecoregion. The trimmed mean and the trimmed standard deviation (SD) were calculated from a 10% cut-off value, based on data between the 10th and 90th percentiles of the distribution. Bahamian (BHM), Eastern Caribbean (EC), Floridian (FL), Greater Antilles (GA), Southern Caribbean (SC), Southern Gulf of Mexico (SGoM), Southwestern Caribbean (SWC) and Western Caribbean (WC).

Ecoregion	Mean	Median	Trimmed Mean (10%)	Trimmed SD (10%)	Min.	Max.	1st Qu.	3rd Qu.
Wider Caribbean	8.12	7.10	7.58	4.18	0.30	25.65	4.68	10.36
SC	19.22	19.26	19.20	2.62	9.54	25.65	17.31	20.92

Supplementary Figure S4. Principal Coordinates Analysis (PCA) plot of the order of the pixels of each one of the heat-stress regions to the left and the years with the most important weight factors in the explanation of the spatiotemporal variation of the annual Degree Heating Weeks (DHW) maxima.

Supplementary Table 17. Descriptive statistics for the regional median Degree Heating Weeks (DHW) values of all days in the warmest months (September, October and November) from 1985 to 2017. The trimmed mean and the trimmed standard deviation (SD) were calculated from a 10% cut-off value, based on data between the 10th and 90th percentiles of the distribution. Bahamian (BHM), Eastern Caribbean (EC), Floridian (FL), Greater Antilles (GA), Southern Caribbean (SC), Southern Gulf of Mexico (SGoM), Southwestern Caribbean (SWC) and Western Caribbean (WC).

Ecoregion	Mean	Median	Trimmed Mean (10%)	Trimmed SD (10%)	Min.	Max.	1st Qu.	3rd Qu.
Wider Caribbean	0.563	0.149	0.339	0.551	0.000	4.856	0.000	0.625

Supplementary Table 18. Corresponding post hoc tests for the heteroscedastic one-way ANOVA for trimmed means for the regional median Degree Heating Weeks (DHW) values of all days in the warmest months (S, O and N) from 1985 to 2017 ($F_{(8, 2761)} = 76.81$; p-value < 0.0001; explanatory measure of effect size = 0.32). The table shows the difference, the confidence intervals (CI) and the p-value for each of the pairwise comparison. CI was adjusted to control Familywise Error rate. In bold are significant p-values for differences in which the confidence interval did not cross by zero.

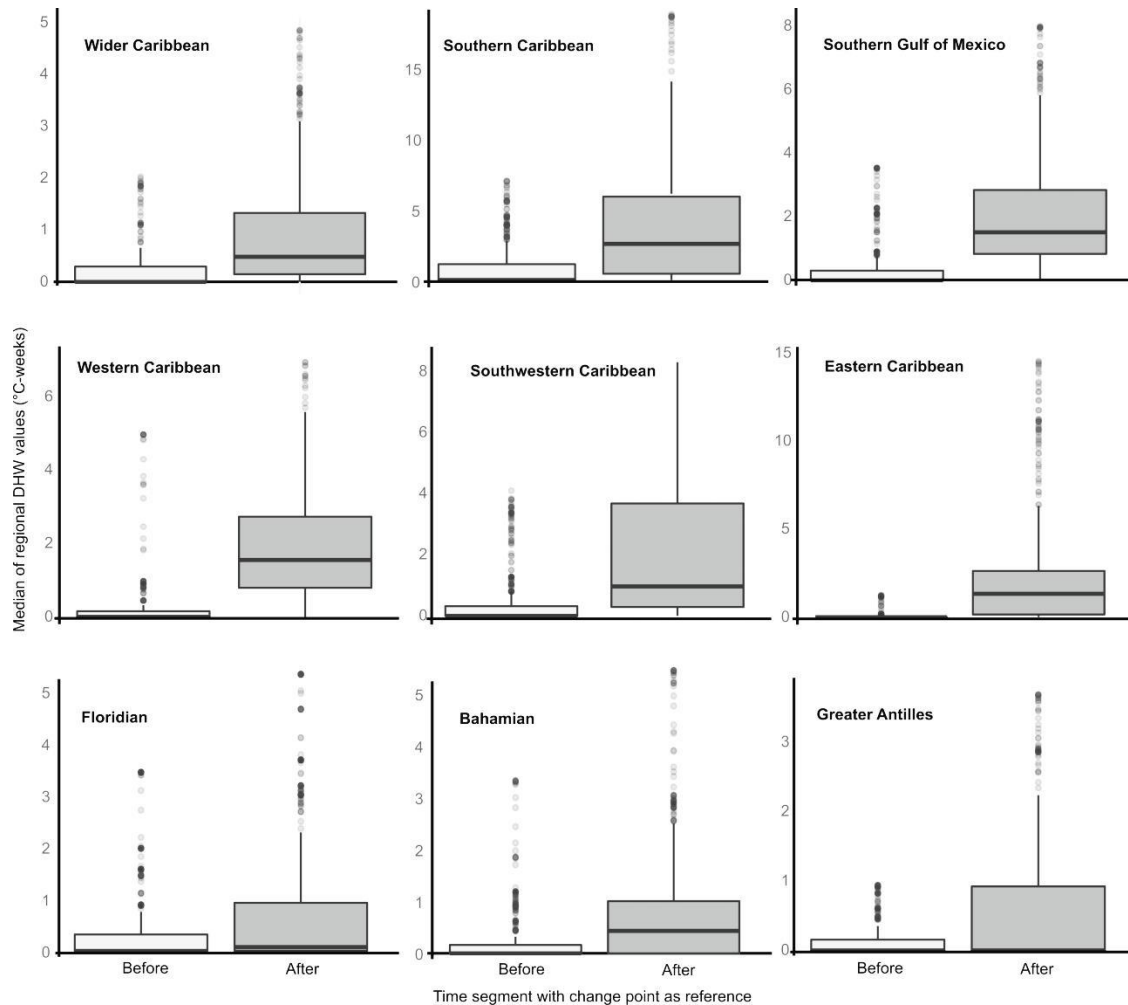

Ecoregions compared		Difference	CI lower	CI upper	p-value

Supplementary Figure S5. Bleaching temporal window of regional Degree Heating Weeks (DHW) in their most relevant years.

Supplementary Table 18. Results of the change in point for the ecoregions using the Pettit test. Change time as DD/MM/YYYY. In bold are significant p-values for the different change points identified.

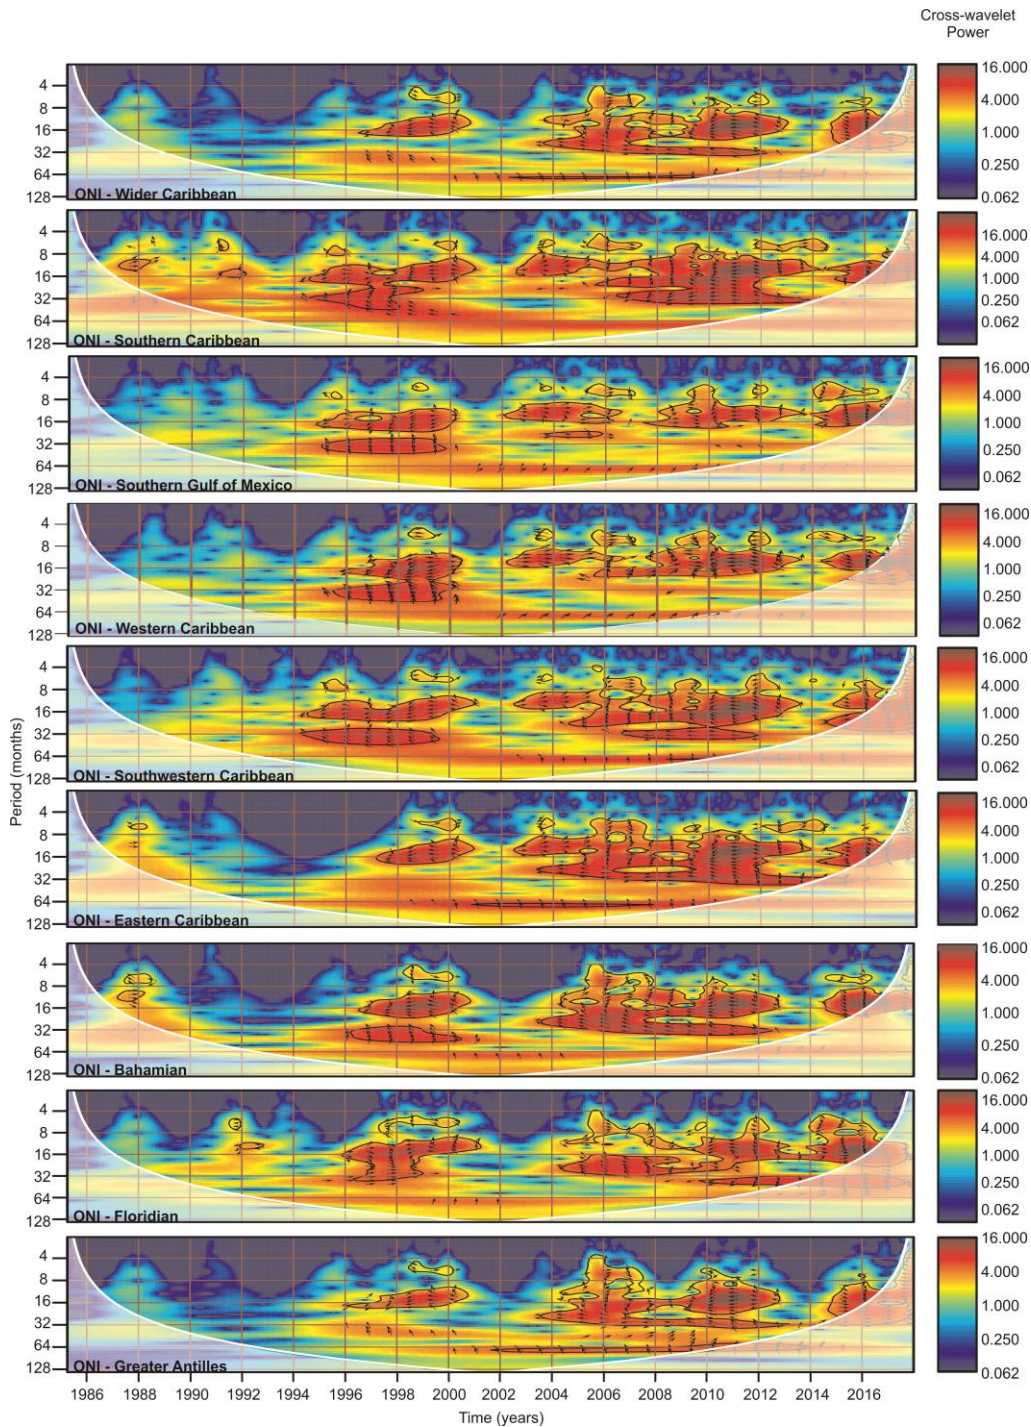

Ecoregion	Pettitt K	change time	p-value
BHM	8693	01/05/2004	0.0012
Wider Caribbean	10510	01/07/2003	< 0.0001
EC	12571	01/06/1998	< 0.0001
FL	6526	01/05/1997	0.0310
GA	5172	01/07/1997	0.1460
WC	12565	01/07/2002	< 0.0001
SC	12112	01/07/2003	< 0.0001
SGoM	10829	01/06/2002	< 0.0001
SWC	15070	01/07/2003	< 0.0001

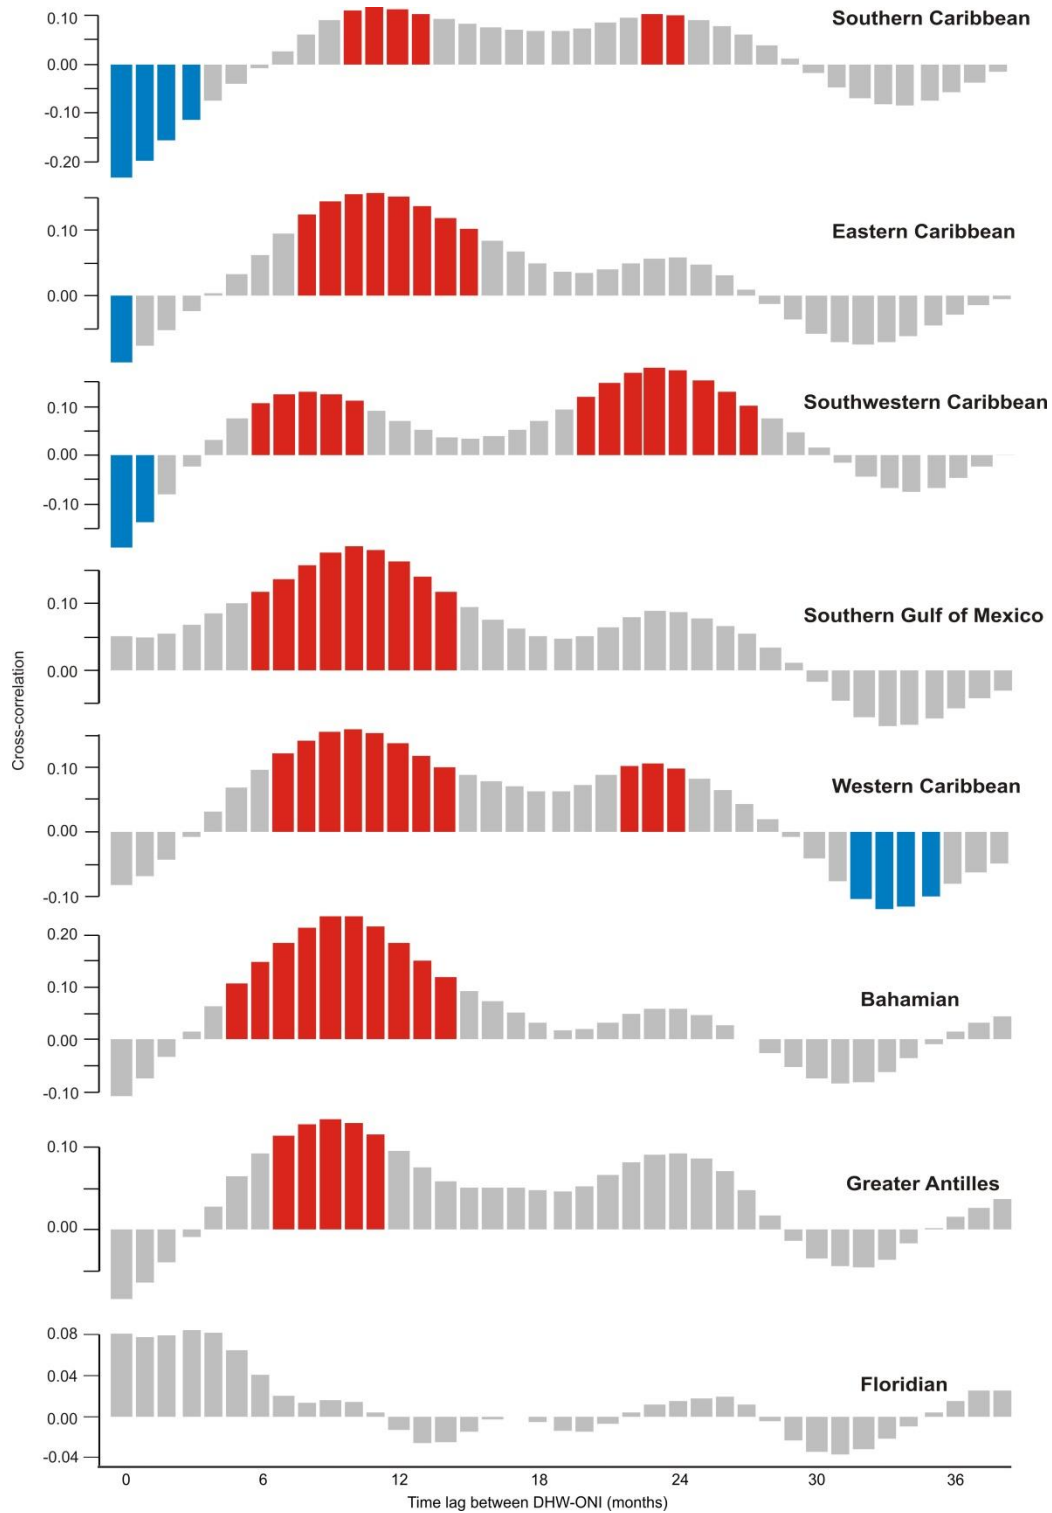

Supplementary Figure S6. Boxplots of the regional median Degree Heating Weeks (DHW) values of all days in the warmest months (September, October and November) before and after the change point identified in the Pettit test for each ecoregion (Supplementary Table 18).

Supplementary Figure S7. Wavelets and spectral average power plots for the wider Caribbean; the ecoregions (SC Southern Caribbean, EC Eastern Caribbean, SWC Southwestern Caribbean, SGoM Southern Gulf of Mexico, WC Western Caribbean, BHM Bahamian, FL Floridian and GA Greater Antilles); and the Oceanic Niño Index (ONI) time series. The color bar represents the spectral power, the black line inside wavelets show the significant periodicities with 95% of confidence. The ‘cone of influence’ is represented by the white shadow, only results outside this region can be considered and interpreted.

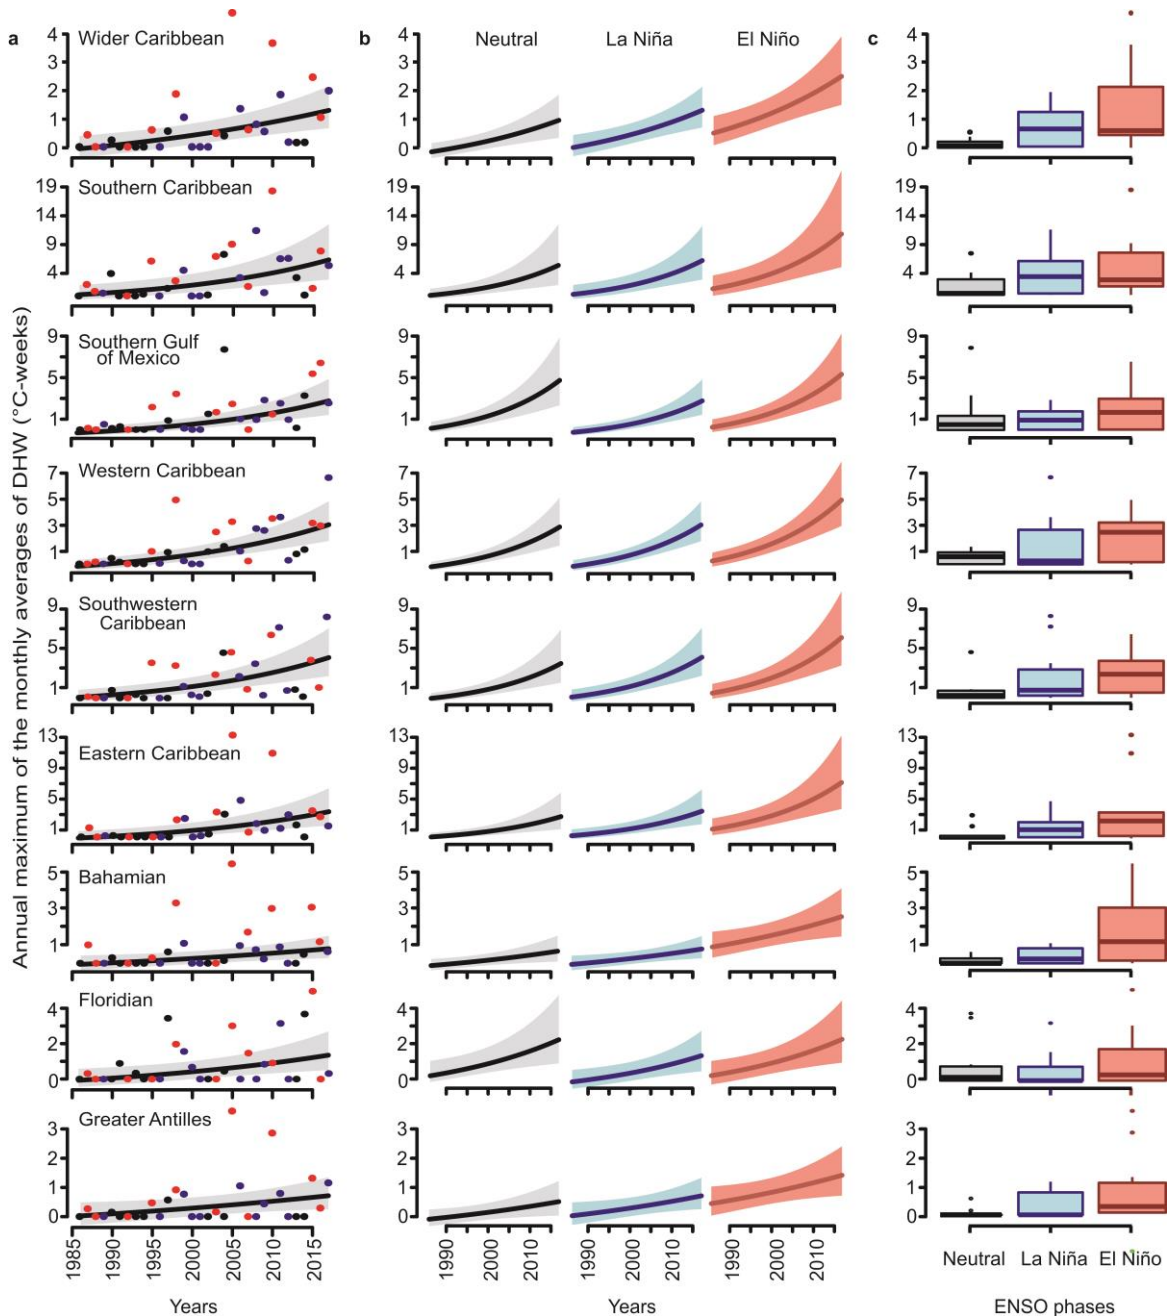

Supplementary Figure S8. Cross-wavelet analysis for the wider Caribbean and its ecoregions showing the common variation between Degree Heating Weeks (DHWs) and the Oceanic Niño Index (ONI). Colors indicate the cross-wavelet power between the ONI and DHW. Arrows indicate the phase difference between the ONI and DHW, phases arrow direction represents: Decreases of ONI and increase DHW (left); increase of ONI and increase DHW (right). Black solid lines show the significance of common periodicities at 95% of confidence. The ‘cone of influence’ is represented by the white shadow; only results inside the cone of influence was ben considered and interpreted (outside the cone = high uncertainty).

Supplementary Figure S9. Cross-correlation between Degree Heating Weeks (DHW) - Oceanic Niño Index (ONI) at different time lags in each of the ecoregions. Red bars represent significant positive correlation and blue bars represent significant negative correlation. Statistical significance designated with 95% of confidence level.

Supplementary Figure S10. Variation of the Oceanic Niño Index (ONI; left panel) and wider Caribbean monthly mean Degree Heating Weeks (DHW; right panel) of the corresponding year. Gray shadow shows the season of mature El Niño phase and the highest DHW values.

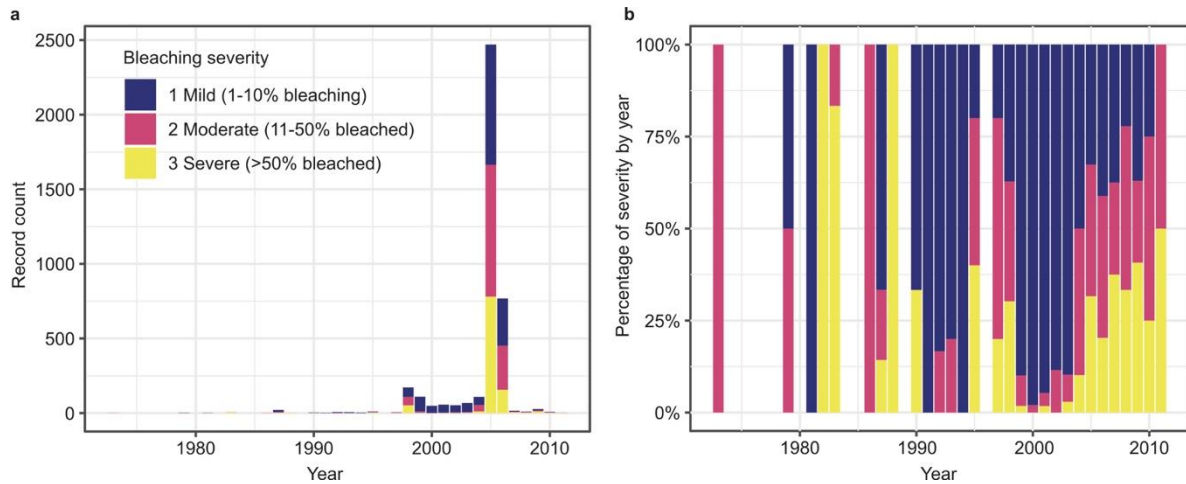

Supplementary Figure S11. Effect of time and ENSO phases in annual maximum of the monthly averages of wider Caribbean and ecoregional DHWs. (a) Conditional plot of time effect in annual heat stress, the color of points represents the dominant ENSO phases in each year: neutral (black), La Niña (blue) and El Niño (red). (b) Cross-sectional plots illustrating the fit of the annual heat stress with an additive interaction between time and ENSO phases (See Supplementary Table 19). (c) Box plots showing distribution of annual heat stress during ENSO phases. ENSO phase category was identified from the ONI time series (http://origin.cpc.ncep.noaa.gov/products/analysis_monitoring/ensostuff/ONI_v5.php), classifying El Niño years as those with anomalies above 0.05°C , La Niña years as those below -0.05°C and Neutral years as those in the range of -0.05 to 0.05°C .

Supplementary Table 19. Comparison of the second order Akaike Information Criterion for relatively small samples, between the Generalized Least Squares and Generalized Linear Model for the annual variation of Degree Heating Weeks DHW with the explanatory additive effect of time and ENSO phases for the ecoregions and the wider Caribbean.

Ecoregion	Model (df)	AICc
Wider Caribbean	GLS (6)	104.23
	GLM (5)	65.89
Southern Caribbean	GLS (6)	182.55
	GLM (5)	154.74
Southern Gulf of Mexico	GLS (6)	137.57
	GLM (5)	103.21
Western Caribbean	GLS (6)	125.45
	GLM (5)	92.81
Southwestern Caribbean	GLS (6)	148.46
	GLM (5)	114.91
Eastern Caribbean	GLS (6)	163.42
	GLM (5)	114.99
Bahamian	GLS (6)	109.86
	GLM (5)	69.64
Floridian	GLS (6)	123.85
	GLM (5)	92.81
Greater Antilles	GLS (6)	94.14
	GLM (5)	55.68

Supplementary Table 20. Coefficient table obtained from the Generalized Linear Model (gamma) for the annual variation of Degree Heating Weeks DHW with the explanatory additive effect of time and ENSO phases in the ecoregions and the wider Caribbean.

Ecoregion (explained deviance)	Terms	Coefficients (Std Error)	t-value	p-value
