The NGS Quality Workgroup developed these documents and tools as examples for use by nextgeneration sequencing laboratories. These documents and tools are not controlled files; format and content must be modified as needed to meet the document control, quality management system or regulatory requirements within your laboratory. It is the responsibility of the laboratory to take any necessary actions to ensure the information within these documents remains applicable.

The NGS Quality Workgroup developed these documents and tools for use by next-generation sequencing laboratories. These documents and tools were developed based upon best available information, reviewed, edited, and approved by the participants in the group listed above. Prior to implementing these processes in your lab, review the date the document was finalized (included in the file name) and take any necessary actions to ensure the information remains applicable. These documents and tools are not controlled files; you are encouraged to modify the format (e.g. header/footer, sections) as needed to meet the document control requirements of the quality management system within your laboratory.

CONDUCTING TRAINING FOR THE ILLUMINA MISEQ SEQUENCER

1.0 Purpose

This procedure outlines the steps for training personnel to acquire the skills and knowledge necessary to run the Illumina MiSeq next generation sequencer from initial sample quality control to the review of sequencing run quality metrics.

2.0 Scope

This document applies to all staff that operate the Illumina MiSeq next generation sequencer and supervisors that oversee these operations. Training on the Illumina MiSeq sequencer is a four-step process that includes building a base of sequencing knowledge, observing the trainer perform the sequencing procedures, performing sequencing procedures under direct trainer supervision, and individually executing the sequencing procedures.

Ion PGM Sequencer Training SOP

Document #:	Revision #:	Effective Date:	Page 3 of 4
-------------	-------------	-----------------	-------------

8.0 Procedure

- 8.1** The trainee will build a basic understanding of Ion PGM next generation sequencing (NGS) technology by:
- Reviewing the relevant Ion support videos (5.4), and
 - Completing the required readings (5.5).
 - Reviewing the Manuals & Protocols (5.6).
- 8.2** The trainer will guide the trainee through the entire sequencing process while referencing the applicable documents or procedures (5.1). This 1:1 review will cover safety requirements, initial sample quality control, library and template preparations, instrument set-up, sequencing, post-sequencing clean-up, review of sequencing run quality control metrics, and other information as warranted.
- 8.3** The trainee will carefully observe the procedure as it is performed by the trainer in the laboratory.
- 8.4** The trainee will perform all steps within the sequencing SOP under direct and full observation of the trainer.
- The trainer will quiz the trainee on multiple aspects of the protocol, including the questions below.
 - Add additional questions the trainer should ask the trainee to determine level of understanding specific to your protocol.
 - What is the minimum concentration of gDNA required to begin library construction?
 - What is the minimum concentration of gDNA library necessary for template preparation?
 - The trainer will review the trainee's results to assess the trainee's competency in performing the procedure.
- 8.5** Once the trainee competently performs the procedure under direct observation, the trainee will perform the procedure unaccompanied.
- The trainer will review the trainee's results to assess the competency of the trainee.
- 8.6** It is the responsibility of the primary user to ensure that preventative maintenance is scheduled and executed.
- The trainee will observe proper user performed preventive maintenance.
 - The trainee will perform user performed preventive maintenance.
 - The trainer will assess the trainee's ability to properly maintain the instrument according to established maintenance procedures.

9.0 Continued Learning

- 9.1** Trainers and primary users should regularly check the Ion Community website for updated tutorials. They should attend Ion PGM webinars, read primary literature, and review new product releases.
- 9.2** It is expected that trainers will try new protocols in the laboratory and teach new skills to primary users.

CONDUCTING PERSONNEL COMPETENCY ASSESSMENT FOR THE ILLUMINA MISEQ SEQUENCER

1.0 Purpose

This procedure outlines the steps for assessing the competency of personnel to run the Illumina MiSeq next generation sequencer from initial sample quality control to the review of sequencing run quality metrics. Competency should be assessed after successful completion of training. Competency assessment is required every six months during the first year the individual tests patient specimens. Thereafter, competency assessment must be performed at least annually. Competency assessment can be done throughout the year by coordinating it with routine practices and procedures to minimize impact on workload.

2.0 Scope

This document applies to all staff that operate the Illumina MiSeq next generation sequencer and supervisors that oversee these operations. CLIA competency assessment consists of six criteria: 1) Direct observation of testing; 2) Monitor recording and reporting results; 3) Review intermediate test results or worksheets, quality control records, proficiency testing results, and preventive maintenance records; 4) Direct observation of instrument maintenance and function checks; 5) Assess test performance; and 6) Assess problem solving skills.

Note that this document is written to meet CLIA requirements; if your laboratory is not subject to the requirements of CLIA, please consult your Quality Manager to tailor the content of this document to meet your laboratory's specific needs.

MinION Training SOP

Document #:	Revision #:	Effective Date:	Page 1 of 5
-------------	-------------	-----------------	-------------

1.0 Purpose

This procedure outlines the steps for training personnel to acquire the skills and knowledge necessary to run the Oxford Nanopore MinION sequencer from initial sample quality control to the review of sequencing run quality metrics.

2.0 Scope

This document applies to all staff that operate the Oxford Nanopore MinION next generation sequencer and supervisors that oversee these operations. Training on the Oxford Nanopore MinION sequencer is a process that includes building a base of sequencing knowledge, observing the trainer perform the sequencing procedures, performing sequencing procedures under direct trainer supervision, and individually executing the sequencing procedures.

-------------	-------------	-----------------	-------------

5.0 Training Information Resources

- 5.1 [Reference your laboratory SOP or the MinION SOP your laboratory uses here.](#)
- 5.2 [Reference your laboratory-developed risk assessment/mitigation document here; this may be specific to the MinION or to the specific nucleic acid source.](#)
- 5.3 Biosafety in Microbiological and Biomedical Laboratories, 5th Edition, HHS Publication Number (CDC) 21-1112
- 5.4 MinION Support Training Videos (select the videos relevant to your lab processes; add other videos as appropriate)
 - a. [MinION: A Portable, Real-Time DNA/RNA Sequencing Device](#)
 - b. [Flongle: For Rapid Nanopore Sequencing of Smaller Samples](#)
 - c. [Loading an Oxford Nanopore Flow Cell](#)
 - d. [RNA Sequencing with Nanopore Technology](#)
- 5.5 Required Reading ([select documents relevant to your lab processes; add other documents as appropriate](#))
 - a. MinION Flow Cell Check Protocol
 - b. MinION Rapid Sequencing Protocol
 - c. MinION 1D Genomic DNA by Ligation Protocol
 - d. Oxford Nanopore Community Discussion Board

6.0 Equipment/Materials

- 6.1 Oxford Nanopore MinION Sequencer
- 6.2 Library preparation and sequencing reagents

7.0 Safety Precautions

- 7.1 All BSL-2 practices, safety equipment, and facility design must comply with the requirements listed in the most current version of Biosafety in Microbiology and Biomedical Laboratories.
- 7.2 Appropriate PPE must be worn at all times when working in the laboratory, including laboratory coat, gloves, and safety glasses (if splashes are anticipated)

8.0 Procedure

- 8.1 The trainee will build a basic understanding of MinION next generation sequencing (NGS) technology by:
 - a. Reviewing the MinION support training videos (Section 5.4)
 - b. Complete the required readings (Section 5.5)
- 8.2 The trainer will perform all steps within the sequencing SOP in the laboratory while the trainee observes.
 - a. The trainer will verbally walk the trainee through the entire sequencing process from the beginning to end using the operational protocol as a training guide (Section 5.5)

The NGS Quality Workgroup developed these documents and tools for use by next-generation sequencing laboratories. These documents and tools were developed based upon best available information, reviewed, edited, and approved by the participants in the group listed above. Prior to implementing these processes in your lab, review the date the document was finalized (included in the file name) and take any necessary actions to ensure the information remains applicable. These documents and tools are not controlled files; you are encouraged to modify the format (e.g. header/footer, sections) as needed to meet the document control requirements of the quality management system within your laboratory.

MinION Training SOP

Document #:	Revision #:	Effective Date:	Page 3 of 5
-------------	-------------	-----------------	-------------

- b. This 1:1 review will cover initial sample quality control, preparing sample libraries, preparing the sequencing instrument, running the sequencing instrument, clean-up, and review of sequencing run quality control metrics.

8.3 The trainee will perform all steps within the sequencing SOP under direct and full observation of the trainer.

- a. The trainer will quiz the trainee on multiple aspects of the protocol, including the questions below, see Appendix A for answer sheet. *(the laboratory should populate this section with additional questions relevant to their procedure):*

- i. Describe how the MinION generates raw signals during sequencing.*
- ii. What can be done if the library does not absorb by capillary action into the SpotON priming port?*
- iii. Why do you open the flow cell priming port and then add 200 µl?*
- iv. Why is it important to have greater than 800 active pores?*
- v. What could cause a large number of unavailable/inactive pores after loading the flow cell?*

- b. The trainer will review the trainee’s quality control data as described in the sequencing protocol to assess the competency of the trainee.

8.4 Once the trainee successfully performs a sequencing run under the observation of the trainer, the trainee will perform an unaccompanied sequencing run.

- a. The trainer will review the trainee’s quality control data and run data to assess the competency of the trainee.

8.5 It is the responsibility of the primary user to ensure that preventative maintenance is scheduled and executed.

- a. The trainee will observe proper user performed preventive maintenance.
- b. The trainee will perform user performed preventive maintenance.
- c. The trainer will assess the trainee’s ability to properly maintain the instrument according to established maintenance procedures.

9.0 Continued Learning

9.1 Trainers and primary users should regularly attend Oxford Nanopore MinION webinars, read primary literature, and review new product releases.

9.2 It is expected that trainers will try new protocols in the laboratory and teach new skills to primary users on a semiannual basis.

Appendix A – Trainer Question and Answer Sheet

i. Describe how the MinION generates raw signals during sequencing.

An ionic current passes through the nanopores. As biological molecules pass through the nanopore the disruption/change in current is measured. The information about the change in current is used to identify the biological molecule.

ii. What can be done if the library does not absorb by capillary action into the SpotON priming port?

Remove a small amount of priming solution and then re-add the priming solution to re-activate the capillary action.

iii. Why do you open the flow cell priming port and then add 200 μ l?

To remove any bubbles from the flow cell's array. This process also creates capillary action in SpotON port, so when the library is loaded it is slowly absorbed into the port.

iv. Why is it important to have greater than 800 active pores?

A low number of available sequencing channels will reduce the throughput of the run.

v. What could cause a large number of unavailable/inactive pores after loading the flow cell?

Loading the priming solution too quickly can cause the membrane to burst, damaging the pores and resulting in unavailable/inactive pores. Over loading the flow cell with too much DNA, and contaminants in the sample can also cause a large number of pores to become unavailable, or inactive.

The NGS Quality Workgroup developed these documents and tools for use by next-generation sequencing laboratories. These documents and tools were developed based upon best available information, reviewed, edited, and approved by the participants in the group listed above. Prior to implementing these processes in your lab, review the date the document was finalized (included in the file name) and take any necessary actions to ensure the information remains applicable. These documents and tools are not controlled files; you are encouraged to modify the format (e.g. header/footer, sections) as needed to meet the document control requirements of the quality management system within your laboratory.

MinION Employee Training Form

Document #: _____ Revision #: _____ Effective Date: _____ Page 1 of 3

Employee Name	Training Start Date

Section I – Base Knowledge (Video and Reading Requirements) *[select videos and documents relevant to your lab processes; add other videos and documents as appropriate]*

Video Title	Trainee Initials	Date Watched
MinION: A Portable, Real-Time DNA/RNA Sequencing Device		
Flongle: For Rapid Nanopore Sequencing of Smaller Samples		
Loading an Oxford Nanopore Flow Cell

Document Name	Trainee Initials	Date Read
MinION Flow Cell Check Protocol		
MinION Rapid Sequencing Protocol		
MinION 1D Genomic DNA by Ligation Protocol		
Oxford Nanopore Community Discussion Board		

Section II – Observation: Trainee observes the trainer perform all steps in the sequencing SOP

Discussion Points	Trainer Initials	Date
Describe how the MinION generates raw signals during sequencing.		
What can be done if the library does not absorb by capillary action in the SpotON priming port?		
Why do you open the flow cell priming port and then add 200µL?		
Why is it important to have greater than 800 active pores?		
What could cause a large number of unavailable/inactive pores after loading the flow cell?		

Section III – Performance under Supervision: Trainee performs all steps in the sequencing SOP under direct trainer supervision

Previously run, well characterized sample(s) will be provided to the trainee. The trainee will:

1. Extract the DNA
2. Perform optional DNA Fragmentation/DNA repair (**1D**)
3. Perform Library Preparation
4. Load the prepared library onto the MinION

The NGS Quality Workgroup developed these documents and tools for use by next-generation sequencing laboratories. These documents and tools were developed based upon best available information, reviewed, edited, and approved by the participants in the group listed above. Prior to implementing these processes in your lab, review the date the document was finalized (included in the file name) and take any necessary actions to ensure the information remains applicable. These documents and tools are not controlled files; you are encouraged to modify the format (e.g. header/footer, sections) as needed to meet the document control requirements of the quality management system within your laboratory.
