## 1. Supplemental methods

#### **Additional information**

Search strategy: We introduced the keywords in the databases as pairs (e.g. menstrual and cup, menses and cup) and combined searches at a second stage. In PubMed, menstrual, menses, menstruation and vaginal were used as Mesh terms and "all fields" terms. Cup is not a Mesh term. To check for completeness, we screened several other databases (See Table S2) for eligible items which were not yet included in the list resulting from the searched databases. We also checked reference lists, web material, and consulted colleagues. Records from the different searches were merged, and duplicates removed; a first screening was conducted to assess potential eligibility whereby irrelevant records were removed, based on the material available (abstract or whole text). Full text articles were obtained as much as possible for the remaining articles, and these were further screened for eligibility. With regards to identifying studies, menstrual hygiene did not need to be the main topic; e.g. studies not completely about menstrual hygiene but presenting useful information could still be included. Language: We did not exclude articles in other languages than English a-priori but decided that in case of retrieval of articles in other languages, an attempt might be done to verify content for inclusion if a person could be identified who mastered that language; however, the search was conducted in English. Searches in Google were repeated for adverse events identified in the literature (e.g. menstrual cup and retention, infection, urination, endometriosis, and toxic-shock syndrome). Reference lists of relevant studies, websites of pertinent professional bodies (e.g. FDA), non-governmental organizations and 'grey literature' (e.g., reports or conference abstracts) were searched, as well as records recommended by contacting experts, to encompass a broad range of available literature. Using pre-tested forms, we extracted data on baseline characteristics and outcomes. Study characteristics included study design, number of participants, age, location, country, time-period of study, type of MC involved, and type of menstrual item used before study, in addition to inclusion and exclusion criteria, and follow up time where applicable. If the year of study was not reported in an eligible study, we assumed it to be two years before the publication date. For studies with outcomes after e.g. cycle 1, cycle 2 and cycle 3, the result for the last cycle was taken. For studies where the follow up was longer, more time points after cycle 2 were included. For some studies, additional information from the authors could be obtained. 1.3 The Picots-framework is presented below.

#### PICOTS Framework

Components	
Population	Menstruating women -Subgroup analysis:  OHigh income versus low and middle-income countries Age: adult vs. adolescent women Type of cup: diaphragm-type of cup (e.g. Instead, which covers the cervix) vs. bell-shape cup (with space between cervix and cup, e.g. Mooncup)
Intervention	Menstrual cup
Control	Other methods for menstrual hygiene management
	1. Direct effects: Improved menstrual hygiene a. Prevention of leaking 2. Indirect effects: effect of cup use compared to other methods on outcomes such as wellbeing and equity  Safety:  1. Serious adverse events 2. Effect on vagina and vaginal flora 3. Effect on reproductive, digestive or urinary tract 4. Safety when sanitary conditions are not optimal 5. Other 6. Factors affecting the use of the cup  Acceptability and user-friendliness: 1. Ease to insert, comfort of wearing, odour, mobility, ease of removal, ease of maintenance a. Willingness to use among potential users or willingness to continue use among new users 2. Costs and availability (cup master list) 3. Knowledge about option of cup among the arsenal of options for menstrual hygiene management (separate search)
Timing	No restriction
Setting	Any trial, quasi-experimental study, survey or other type of study reporting on experiences with cup use for menstrual hygiene management. Search in English

## Additional meta-analysis methods for quantitative studies

When using meta-analysis, the extent of heterogeneity was measured using the  $I^2$  statistic,<sup>4</sup> which is a measure of the proportion of total variability explained by heterogeneity rather than chance expressed as a percentage, with 0–40% representing no or little heterogeneity, 30–60% moderate heterogeneity, 50–90% substantial heterogeneity, and 75–100% considerable heterogeneity.<sup>5</sup> We examined the following sources of heterogeneity if sufficient data were available using subgroup analysis: setting of the study (high-income [HIC] versus LMIC), study population (adult women versus girls aged 12-17 years), year of study (study conducted before or after 2000), type of menstrual cup used (cervical versus vaginal cup) and duration of menstrual cup use. We assessed publication and small-study bias by visual inspection of funnel plots for the outcome of reported MC use in the future.<sup>6,7</sup>

## Methods qualitative analysis

We followed the Critical Appraisal Skills Programme tool to examine the quality of the studies. While the tool does not provide a definitive score to judge studies on their quality and / or include or exclude them, it enables the reader to understand the rigour of each study and the transparency of reporting, thus facilitating judgement of quality and interpretation of results. Two reviewers (LM and GZ) assessed each study independently, and examined and summarised the findings from these studies in combination to ensure a more robust and comprehensive explanation than would occur if each individual study was considered in isolation. The data were analysed using thematic synthesis as described by Thomas and Harden (2008). Separately, the 2 qualitative reviewers extracted the themes and subthemes, along with illustrative quotes where applicable, from a first paper, and repeated this process for additional papers until a complete table of themes and subthemes with quotes was devised. A comparison of both tables was made, and a single definitive table produced. From this, the reviewers identified six key themes and eight subthemes, which were written up in narrative form with illustrative quotations. These qualitative results were integrated with quantitative results in the results section, but the full results are also available in Supplement section 3.1.

## Methods visibility and accessibility

To assess visibility of the menstrual cup, we used websites of governments and non-governmental organizations to obtain education materials to prepare girls for menarche from countries where the review-authors were familiar with the language (English, German, French, Spanish, and Portuguese; conducted by GZ, ML & AMvE). Search terms for this part included a country name, "menstruation", and "information", separate and in combination with "adolescent girls", and terms were translated where applicable. Websites from commercial providers of menstrual items were excluded, where identified. We compiled if sanitary pads, tampons and menstrual cups were reported in the material.

To assess the availability and price of menstrual cups, we used the "Menstrual Cup Master List", a web source of vaginal menstrual cups available globally, <sup>11</sup> and other sources (e.g. websites from menstrual cups and experts) to find countries where brands were based. Each individual brand was searched to identify its availability for purchase, through the web or otherwise. We determined if a cup was available in a country. If it was available for sale in a retail store or if you could purchase it directly through their website or an intermediary ecommerce website locally. Where possible we identified the countries in which each brand was purchasable, and its respective price. When brands had no country of origin listed, company FAQs and consumer reviews were scanned to identify brand location. Prices reported in local currencies were converted to United States Dollars with the applicable exchange rate on 31 August 2018. If there were a range of menstrual cup products available for purchase, we selected the "original" model. If items were available for bulk purchase at a subsidized cost, we selected the purchase price when buying an individual unit. If individual units could not be purchased, we divided the bulk price by the number of units to calculate the individual unit cost. When pricing differed across adolescent and adult users, we selected the "adult" size for comparison purposes. We also checked with experts to find out if there were cups which were missing on the list. Between July 2017 and August 2018, 145 brands available for purchase (141 with an identified country of origin) were compiled. When separating cups by country wealth quartile, we classified countries according to the 2017 Atlas rankings developed by the World Bank. This method sorts countries by Gross National Income per capita.

## Methods for comparison of costs and waste

For estimates on use of pads and tampons, we used estimates from included studies. <sup>12-14</sup> However, because use of sanitary products may depend on type of flow, we decided to examine a range, varying from 9 to 25 items per month (Table S16). For estimations on costs of pads and tampons, we explored prices for Tampax (cardboard applicator) and OB tampons, and Always and Kotex pads in the USA, the UK, India, Spain, China and Canada on Amazon Prime (data obtained on 5 October 2018, GZ & AMvE); prices were converted in US dollars using the conversion rate on August 31, 2018 and calculated price per pad or tampon (Table S12). The average cost for one tampon and one pad was 0.21 dollar (range 0.12-0.38) and 0.31 US dollar (range 0.15-0.55), respectively. For estimates on weight and information on biodegradable content we used the report by Mazgaj et al. (2006) for a Libresse pad and OB tampon. <sup>15</sup> We used 6.8 grams as the weight of a menstrual pad and a plastic content of 35% of the weight; corresponding numbers for tampons were 3.6 grams and a plastic content of 4% of the weight. As an estimate of monthly blood loss we used 35 ml (normal range is 5-80 ml). <sup>16</sup> For the menstrual cup estimates we assumed a vaginal cup with a life time of 10 years, weighing about 15 grams, and the median price of a menstrual cup in US dollars as previously obtained. We did not include the amount of blood lost in the calculation of waste for the menstrual cup, because this blood is not absorbed as in a tampon or pad.

## Changes with protocol

We were unable to access the database Psychinfo. We screened the first 50 pages (500 entries) of Google Scholar. In addition, we screened the databases Science.gov and WorldWideScience to check if our information was complete. We excluded studies where the MC was purely used to obtain gynaecological samples, even if data on the experience of participants was presented, because generally their experience only covered a select period of one cycle. For quality assessments of included cohort studies we used an adaptation of the Newcastle-Ottawa tool. Limitations of this tool were the absence of a clear non-exposure group and verification of exposure and outcome. In studies where experiences among menstrual cup-users were compared with their previous experiences with other menstrual products, we assumed a before-after design, with a non-exposed group having the same characteristics as the exposed group. A study was considered moderate-to-good, if at least 4 criteria had been satisfied in the adapted Newcastle-Ottawa score (Table S1) or 5 in the Cochrane tool for trials. Because of the wide variability in types of reported outcomes, e.g. for leaking, we could not combine results from different studies using a risk ratio. We compared reported outcomes; however, given that most studies were "before-after design", using the same women reporting for experiences with MC and routine products, the use of a chi-square test would have been inappropriate but insufficient information was available for a

McNemar test. We intended to use the quality assessment as part of meta-regression and sensitivity analysis but decided not to conduct meta-regression because of the limited number of high-quality studies for meaningful comparisons, and the limited added value when conducting meta-regression.

Table S2. Adaptation of quality assessment form for observational studies

	Focus area	Category options†
1	Representativeness of the exposed group	a) truly representative of women in the community (e.g. random selection in community) *     b) somewhat representative of the average woman in the community *
	<ul><li>a) Is a description how women were recruited present?</li><li>b) If there is, are women</li></ul>	c) selected group of women (e.g. women who were enrolled from a clinic population) d) no description of the derivation of the group
	representative of women in the community?	Adaptation: 1 point if description present and women representative of women in the community (if not clear how recruited, or recruited from a clinic: 0 points).
2	Selection of the non-exposed group	a) drawn from the same community/pool as the exposed group *     b) drawn from a different source     c) no description of the derivation of the non-exposed group
		Adaptation: If information is used from women before they were enrolled (e.g. a before-after study), or if there is control group that is coming from the same source as the exposed group: 1 point. Otherwise 0.
3	Ascertainment of exposure	a) Inspection cup or colour change cup, or cup in situ b) combination of cup inspection and interview c) unsecure record d) written self-report e) no description
		Adaptation: If cup colour change used 1 point, otherwise no objective measure: 0 points.
4	Comparability of exposed and unexposed group	differences examined and no differences reported in characteristics which are presented *     differences in characteristics present but no effect on outcome, or multivariate analysis for outcome available or randomized study *     differences in characteristic present, not shown if effect on outcome     no description/not examined
		Adaptation: If it is comparable to a before-after study or a comparison among characteristics of
5	Outcome assessment (leakage, frequency of change, vaginal inspection, bacterial cultures): not possible	women who used and did not use the cup and no differences, 1 point. If it is not present, 0 points.  a) independent blind assessment (observations or laboratory tests) * b) record linkage (for observations or laboratory tests) * c) not clear d) no blind assessment (verbal or written reports) e) no description
		Adaptation: if laboratory tests or inspection of vagina 1 point, if verbal report 0 points.
6	Attrition	<ul> <li>a) complete - all subjects accounted for *</li> <li>b) outcome not available for all subjects but unlikely to introduce bias - small number lost -</li> <li>&lt;20%, or description provided of those lost *</li> <li>c) outcome for less than 80% of people with exposure data and no description of those lost</li> <li>d) no statement</li> </ul>

<sup>\*</sup> A study could be awarded a maximum of one point for each item, so in total 6 points.

Table S6. Other functions of the menstrual cup

Function	Cup type	Numbers (%) or description	Notes	Source
Reduction or control of leakage from enterovaginal or vesicovaginal or vesicouterine fistula	NR (vaginal)	Case report: Symptoms of urine leakage improved during menses when she used a menstrual cup	"When evaluating women with urinary incontinence and a history of caesarean deliveries, use of menstrual cup may aid in the diagnosis of vesicouterine fistula."	Goldberg 2016 <sup>47</sup>
	NR (vaginal)	2 case reports	"In two cases of vesicovaginal fistula, the menstrual cup was used with great success for control of urinary leakage"	Parker 1966 <sup>37</sup>
	NR (vaginal)	Three case reports of menstrual cup use to assist in palliative therapy	"This simple and inexpensive device should be considered in those cases in which the drainage can be diverted as a viable option, especially in those who are symptomatic and awaiting surgical repair or in those for whom surgery cannot be performed."	Russel 2016 <sup>48</sup>
	NR (vaginal)	Study to assess the feasibility and acceptability of the vaginal menstrual cup for short-term management of vesicovaginal fistula (VVF) among 11 women seeking treatment at a health facility in Ghana.	"The repeated measures design utilizes a 2-hr pad test to compare urinary leakage with and without the insertable cup" "With the cup, women experienced an average 61.0% (±37.4) (95% CI: 35.9–86.2) leakage reduction, a difference 10/11 users (91.0%) perceived in reduced leakage." "Acceptability and appropriateness among women was high as most could easily insert (72.73%), remove (72.73%), and comfortably wear (100%) the cup"	Ganyaglo 2019 <sup>32</sup> Ryan 2018 <sup>33</sup>
Contraceptive	Gynaeseal (reusable cervical cup)	33/73 (45.3%) women used the cup as contraceptive: 1 unplanned pregnancy (follow up 18 months after start of study)	In this study it was not used in combination with spermatocides	Cattanach 1991 <sup>29</sup>
Facilitator of intercourse during menstruation	Soft cup (disposable cervical cup)	The soft cup was worn during intercourse by 67 subjects in cycle 1, 61 in cycle 2, and 58 in cycle 3. Nine women reported discomfort, 13 partners reported discomfort.		North and Oldham 2011 <sup>14</sup>

## Other use of MCs

The cervical cup has been referenced as a possible product to allow intercourse while menstruating with potential as a contraceptive.<sup>29</sup> Vaginal cups have been used for the diagnosis, reduction or control of leakage from enterovaginal, vesicovaginal, or vesicouterine fistulae.<sup>32,37,47,48</sup>

## Section 2.1. Qualitative studies

## Study characteristics qualitative studies

Of the six studies identified with qualitative information, three were methodologically weak, one was satisfactory and two were judged as high quality (Table S6). <sup>24,25,41,49-51</sup> No studies were excluded due to the limited number; however, in recognition of the lack of robust evidence we selected findings that were evidenced in at least 3 of the 6 studies. The six studies (Table S7), all in developing countries, included a total of at least 225 participants (the study by Care International 2018, <sup>43</sup> did not report total number of participants taking part in the FGDs), although not all had received a cup; <sup>50,51</sup> 75 participants took part in an interview (described as in-depth interview or semi-structured or personal interview, 47.2% school girls) and a minimum of 193 were in 21 focus group discussions (FGDs, 72.5% school girls). Data were collected at 3-6 months after participants received a cup (not available for one study). Four studies described the participant selection strategy. <sup>41,49-51</sup> Two studies reported data triangulation and triangulation of analysis. <sup>49,51</sup>

FGD=Focus Group Discussion. MC: Menstrual cup. NR=not reported. \*Mason et al. (2015): 4 FGDs among cup users, and 2 FGDs among parents or teachers of girls who used cups.

## **Description of qualitative results**

Although a range of themes were evident within the studies we identified the following 6 themes as important, with evidenced in all or most of these studies with supporting quotations and / or author narrative: Initial apprehensions; Becoming accustomed; Resolving issues, restoring dignity; Challenges; Effect on schooling; Economic benefits. The first three themes provided the most material and numerous similar quotations and appeared to be stronger themes overall.

<u>Initial apprehensions</u>: Within this theme, subthemes arose around fear of the unknown, fear of the size, and fear of adverse events. All studies noted that participants frequently opined how shocked they were on viewing the cup for the first time, little realising how big it would be: 'but first days when we saw it we thought – it is too big! It cannot fit!' Many voiced concerns that it might

cause pain (and indeed noted that it did often did so at first) or even had potential to cause reproductive harm to the wearer. However, there was little or no evidence presented in these studies that this had much lasting effect in preventing participants from using a cup. Three studies additionally described members of the community also giving similar comments to the participants such as 'I still fear because they said that .....[the cup] had been brought to us so that girls don't produce').

Becoming Accustomed: All studies described ways in which girls became accustomed to wearing the cup with time, practice, peer support and training being key to successful use. 'The first time, I found it difficult and ... I came back to use pads. Then another month began. I tried [the cup] and felt like my waist was paralyzed. I then used it and the next day I used it and I then found using it became easy and I now use it.

Noted in 3 of the studies, peer support appeared important in overcoming this barrier, with quotes suggesting that having peers describe cup usage in positive terms, or sharing ways of inserting / wearing, would encourage struggling participants to try and master usage for themselves. 'In the beginning I was fearing but my friend also told me just pick it, maybe you will like it later...My friend said I am even using it and I am so free, so I decided to use it. If not, I would have been waiting'. It appeared that information provided in cup training particularly by those teachers / researchers who used the cup themselves, may also have had a positive effect in supporting and encouraging participants to resolve any issues, although there was minimal supporting quotations provided within the papers.

Resolving Issues, Restoring Dignity: Within this theme 3 key subthemes were apparent, leakage, comfort (also seen as health benefits), and feeling 'free' - these going some way to reduce the shame and embarrassment and isolation that menstruating girls and women suffered from. There were frequent positive quotations suggesting that the menstrual cup was a solution to problems they frequently faced during menstruation which included leakage, staining of clothes and on occasion dropping of the absorbent which resulted in embarrassment or shame). All studies evidenced participants describing leakage as a problem which was resolved when using a cup. They described relief from constant worry that their clothes would be stained, or the need to keep checking this did not happen, which appeared to be the norm with traditional items and even with sanitary pads. 'You feel free, unlike pads, because pads you have to check all the time..... you even sleep freely, no problems with anything'. Comfort was also repeatedly described as a benefit that participants observed when using a cup in comparison to their experience with alternatives. Recurring comments stemmed around the inability to feel it once inserted correctly, whilst there was also occasional comparison with pain, discomfort or bruising or itching that can occur with a pad or cloth, hence also being also termed 'health benefits'. Feeling 'free' from the physical restrictions of wearing a pad or a cloth also appeared to be another positive outcome reported around cup use as it gave participants liberty to undertake physical activities that were restricted or impossible when using other forms of menstrual protection such as bike riding, playing, running etc. 'It was as if I am not on my period...[The cup] doesn't leak, it is comfortable and I can even bike. It doesn't hurt like disposable pads, where sometimes I wouldn't feel like even asking. Now I am free to do whatever I want and walk and bike as long as I want'. However, freedom also came from the lack of worry, such as not having to constantly check for leakage.

<u>Challenges:</u> A range of challenges were evidenced in relation to using a cup. Three of the studies described some difficulties with cleaning and storing of the cup, these included finding a suitable container in which to boil the cup, having to ensure that cleaning is done in private as well as keeping the cup safe from rats or being stolen in between menses. Other challenges related to having water to wash the cup, changing the cup, notably in school or public toilets in the event of a queue or with minimal time, and also at night where security was an issue. 'it would be tricky going to empty the cup in the public toilets especially when you are travelling and maybe there is a queue, someone is banging on the door for you to finish quickly, and in the process of hurrying, it can easily drop in the toilet'.

Effect on Schooling: The influence that cup use had on school attendance was described in 3 studies with the implication that attendance was improved since participants received a cup. 'That thing is also good because let's say you are using pads and then the pads gets finished before you have finished your periods and there is no money to buy more so for you, you will stay at home but school continues normally; You stay at home because you fear the leaking, that is where I find the difficulty' The same studies also reported on the improvement in concentration and freedom from worry which may in turn improve performance and these were linked to the subthemes described above of reduced leakage, comfort and feeling free.

Economic Advantage: Lastly, the economic advantage of having a cup emerged as a finding in 4 of the studies, with participants (and families) happy not to have to spend or 'waste' money each month on a pad or soap for washing cloths. It gave them the opportunity to purchase other essentials. In some cases, this appeared to be a key incentive in adopting up usage despite initial fears. Just one study included a participant quote illustrating that it also reduced the need for transactional sex to purchase pads.

	s in qualitative studies	a: 11
Theme	Source Text	Studies 24,25,41,49-51
Initial apprehension	"In the beginning I was fearing but my friend also told me just pick it maybe you will like it later I also talked to other girls myself, who feared trying it. All I know are now using it." 41	24,25,41,49-51
	'When they distributed the cup I also feared much. My younger sister inserted the thing first, and then I asked her whether it is painful. She replied yes it is painful. I then said if it is painful I will not insert it, but I then took courage and inserted it.' 49	
The unknown	'I thought it was a strange thing, I had never seen it before. I had never heard about it [] I felt it was very strange.' 50 'but first days when we saw it we thought – it is too big! It cannot fit!' 51	
Size	'We like [the cup] but when we had just received it and went home with it our mothers were saying that thing will destroy our uterus; it is big, it will widen our female organ and enlarge our uterus.' 51	
Fear of adverse events	'A certain woman told me not to use that thing because it can prevent me from giving birth in future.' 51	
	'I still fear because they said that [the cup] had been brought to us so that girls don't produce.' 49	
Becoming Accustomed	'I felt pain, then I said to myself 'this thing is difficult to insert' then I said again, 'no, I heard people talking that it is good', so I went to try again. So from that day up to now I have been using it.' 51	24,25,41,49-51
Peer experience	'In the beginning I was fearing, but my friend also told me just pick it, maybe you will like it laterMy friend said I am even using it and I am so free, so I decided to use it. If not I would have been waiting. I also talked to other girls myself, who feared trying it. All I know are now using it.' 41	
Practice	'The first time, I found it difficult andI can back to use pads. Then another month began. I tried [the cup] and felt like my waist was paralysed. I then use it and the next day I used it and I then found using it became easy and I now use it.' 49	
	'Why I felt that that that thing is good was because of how they explained; how to fold, insert, all made me feel that using it is easy and I joined and received it.' 49	
Training & support	'If she says [the cup] is difficult to use, you tell her that she should try it this way. You tell her how you tried and that is why you got used to it.' 49	
	'I thought I had to try to because during the education they said that it can feel weird in the beginning but if you repeat and repeat it is better. So I was thinking, I should repeat and repeat and then it started feeling fine.' 50	
Resolving Issues, Restoring Dignity	'Because when you put the cup, the blood cannot come out. But with the pad, it can move aside so you get blood on the outside, you get dirty and feel ashamed.' 50	24,25,27,41,49- 51
Leakage	'It has helped me because before if I use [brand] sometimes I could find blood stain on my clothes and you know that is embarrassment, but since the Mooncup was brought, if I insert it I just feel free and do not even have it in my mind '51	
	'in class you are not worried that you will spot and people will know that you are menstruating. It doesn't leak and I no longer have to keep running to the toilet to change.' <sup>25</sup>	
	'it collects all the blood inside and it doesn't leak like when you are using the pad, which you have to keep changing, otherwise it leaks.' 49	
Comfort / health	'You will also avoid itching because of the dryness.' <sup>25</sup> 'Because it doesn't give bruises or blisters. You feel more comfortable, you feel free.' <sup>50</sup> '[using the cup] is so much more easy. When pads have been there for long, it gets too warm, and uncomfortable. It was as if I am not in my period[The cup] doesn't leak, it is comfortable and I can even bike. It doesn't hurt like disposable pads, where sometimes I wouldn't feel like walking. Now I am free to do whatever I want, and walk and bike as long as I want.' <sup>41</sup>	
	'It is good because you cannot get skin rashes, unlike pads, after using you will have irritations and maybe bruises, but Mooncup does not.' 51	
	'You are very comfortable and you can do so many things with the cup on. You will walk freely with your head high.' 25	
Freedom	'I feel free, unlike pads, because you have to check all the time, you also cannot drive your bike. Now I can drive my bike and I don't have to look back, I don't fear, now I can stay for a long time at gatherings. You even sleep freely, no problems with anything.' <sup>41</sup>	
	'I'm feeling good because when I put that Mooncup inside I can run, I can do anything.' 51	
	I found using it was interesting and easy because once you have inserted it you can play so freely you will not feel that there is something in your body.' 49	
Challenges	'At school there are times when there is no water and during those times I don't remove my cup at all until I reach home. Because I need water to pour in the toilet and also to rinse the cup with because I cannot leave the toilet like that.' <sup>25</sup>	24,25,27,41,49
Water / cleaning / security / changing	'In Korogocho you cannot go out at night so I have a plastic container that I use. I pour the menstrual blood in it, rinse the cup with water and use it again. In the morning I can go and pour that waste in the toilet and then wash the container.' <sup>25</sup>	
	'there was a problem of getting a tin for boiling.' 49	
	'I received re-usable pads but because they required so much water, my grandmother, who I live with, discouraged me from using them because they were wasting the little water we had'27	

	'Some peoplethey understand that it is used like this, so that they get a day and steal it, and indeed for some people [their cup] was stolen because they explained it all.' 49	
Effect on Schooling Attendance	'My periods used to come so much that it would even prevent me from coming to school. When I used that cup I found it was good because once it is full I would know and go and change. Even now I stay freely among my friends.' <sup>49</sup> 'It can improve their performance because they will now concentrate more on their studies, not on how she will manage her periods because sometimes the teacher is busy teaching and she is just thinking about periods.' <sup>51</sup>	24,25,49,51
Performance / concentration	'I won't have to keep on checking and being worried that it might leak, unlike the pad which I have to be checking all the time. I will be able to concentrate in class. This will really help.' <sup>25</sup> 'Before I got the cup I found it really difficult when I was in my period to go to school. I really feared shame if I was seated and the blood can smell. Really I had that fear. But since I received the cup I can put in the cup and it can just hold the blood.' <sup>27</sup>	
Economic Benefits	"I had a lot of fear in the beginning, but I kept on using it because I could see that it was a smart and cheap solution." <sup>41</sup> 'I used to spend 5,000 Ugandan shilling for pads, now I can spend it on something else, I am so happy for that.' <sup>41</sup> 'That cup I liked it because they said it will last for 10 years, so I felt that for the10 years, it will help us not to waste money.' <sup>49</sup> 'You will save costs of water and soap.' <sup>25</sup> 'When I [attended] the education of the cup I was thinking that the pads are expensive for me and that the cup will not be expensive for me, so I thought it's better to learn to use it and save money.' <sup>50</sup> Since the project started I now feel comfortable because when I use the cup, instead of thinking where I'm going to get money to buy pads, I am using the cup and the cup is really helping me' <sup>27</sup>	24,25,27,41,49,50

Note: Past and current menstrual cups. In the study by Cheng et al. (1995), a vaginal cup with a valve in the stem was used.<sup>30</sup> Leakage during menstrual cup use was reported in various ways; eleven studies with twelve data points provided information (1264 participants)

Table S10. Use of menstrual cup, product related discontinuation and other loss to follow up

Study	Cup brand (type)	Follow up time with cup use	Could not insert cup n/N (%)	Used cup at least once (verbal report documented) n/N (%)	Cup-related discontinuation n/N (%)§	Loss to follow up for other (or unclear) reasons n/N (%)

NR=not reported.

<sup>\*</sup> Cross-over of menstrual cup and pad users possible after 2 months in the study. Random: these participants were randomized to receive the menstrual cups. Choice: these women obtained the menstrual cup by choice.

<sup>†</sup> Monitoring and evaluation of distribution program in Tanzania in Kilimanjaro region;<sup>2</sup> 2 girls were not allowed a menstrual cup and 5 girls reported to have lost the menstrual cup

<sup>‡</sup> For forest plots see Figures S7-S10

<sup>§</sup> Reasons for cup-related discontinuation: Cheng 1995: (cup with drainage tube that can be unplugged) too long (29%), difficult to insert or position (25%), uncomfortable (25%), messy to unplug (17%), difficult to use during light flow (4%). Femme international: main reasons fear, difficulty inserting and pain.<sup>30</sup> Kakani 2017: feeling messy (2 women), could not insert cup (2), difficult removal (2).<sup>35</sup> North 2011: poor fit (11 women), messy (4), cramping (4), difficult removing (4), didn't like it (3).<sup>14</sup> Oster 2009: one girl did not like the MC.<sup>20</sup> Shihata 2014: (no numbers available): device too big, variable degrees of prolapse of cervix, not able or wanting to insert.<sup>39</sup>

<sup>| 80</sup> responders among 259 women approached by (slow) mail after 18 months.<sup>29</sup>

Figure S9. Time trends for menstrual cup use in four studies with information from developing countries

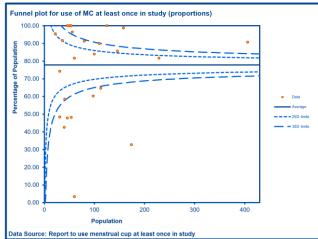

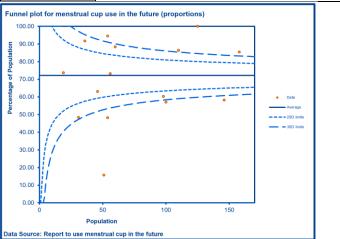

Note: In the study by Hoffman et al.  $(2014)^{19}$ , there was an option to obtain pads among women randomized to menstrual cups from 2 months onward. In both studies by van Eijk et al.  $(2018)^{52}$  and Oster et al.  $(2009)^{20}$ , there was regular contact between study staff and participants. In the study by van Eijk et al.  $(2018)^{52}$  peer support was also provided. Although peer education was absent in the study by Oster et al.  $(2009)^{21}$ , they do show that friends who use the cup are important for successful uptake.

\*For comparison, the cup colour change over time is included, as reported by van Eijk et al. (2018).<sup>52</sup> In this study, mooncups were used, which show a discolouration after use. This may be considered as a more objective measure of use compared to verbal report and may better illustrate the learning curve for cups. Note that this is aggregated data per quartile. For information by month, see the article.

Figure S10. Sensitivity analyses, funnel plots and small-study effect

Sentivity analyses results			
Outcome	Number of	Number of low-	p-value for
	high-quality	to-moderate	subgroup
	studies or	quality studies or	difference
	subgroups	subgroups	
Could not insert cup	0	11	
Use MC at least once (verbal report)	0	25	
MC-related discontinuation	0	10	
Other discontinuations	2	13	1.00
Difficult to insert	2	15	0.11
Uncomfortable to wear	1	11	0.55
Difficult to remove	1	6	0.30
Wants to continue using the cup	1	14	0.53

SD=standard deviation. MC=menstrual cup.

Notes: The control limits or 'funnels' represent the bounds of statistical confidence around the average value. Specifically, this means that any observation plotted within the funnel limits will have a confidence interval which includes the average value. Conversely, the confidence interval of any observation plotted outside the funnel limits would not include the average value, and may therefore indicate unexpected deviation from the norm. It is clear in these plots that most of our data points fall outside of the 2SD limits. Asymmetry in funnel plots suggests a potential for small-study effect with smaller studies (larger standard errors) showing greater treatment effects; most of our studies have small (<100) sample sizes; given the lack of studies with larger sample sizes and the wide variety in study populations and outcome measures used, it may not be possible to assess this effect properly. The two-sided p-values for asymmetry of the funnel plots by Egger's test were 0.353 for use of MC at least once and 0.366 for future use, providing no evidence for the presence of small-study effects.

For the other outcomes examined the Egger's test is presented below:

Outcome	Number of studies	p-value Egger's test
Could not insert cup	8	0.041
MC-related discontinuation	9	0.86
Other discontinuations	12	0.54
Difficult to insert	18	0.46
Uncomfortable to wear	11	0.48
Difficult to remove	6	0.22

Table S13. Other outcomes examined in association with menstrual cup use

Study	Study type	Comparison	Outcome	Menstrual Cup	Alternative	P-value
Phillips-Howard 2016 <sup>1</sup>	Cluster randomized trial	Vaginal cup vs. pad vs. usual	Drop out of school – all users***	11.2%	pads 10.2%; usual item 8.0%	>0.05

$2017^2$	choice Tanzania			6 months	6 months	

NR: Not reported.

<sup>\*</sup> When data were stratified by duration of use, participants provided with cups for 9 months or 12 months and longer had significantly lower prevalence of school dropout, STI, and BV † p value for cups v control for sexually transmitted infections combined, adjusted for covariates

<sup>‡</sup> Hoffman 2014<sup>19</sup>: Assumed 11.9% loss to follow up at 2 months as reported by authors. In this trial with an elaborate design there was ability to cross-over in some clusters at 2 and 6 months: "Usage of menstrual cups fell off sharply when these women were later given pads, suggesting that many women prefer pads, but will use the cup if pads are not available or affordable".

## Section 2.3 Visibility, availability, costs and waste

## Visibility of MCs

Three studies in HIC with information on potential use of a MC suggested MCs were not well known, with only 11-33% of the persons interviewed aware,  $^{44-46}$  although interest in a fourth study in Zimbabwe was considerable (Table S14). We identified 69 websites from 27 countries and one international organization with educational or teaching materials to guide adolescent girls through menarche (Table S15); disposable pads, tampons, MCs, and reusable pads were reported by  $76\cdot8\%$ ,  $65\cdot2\%$ , 30.4 and 21.7%, respectively, with some regional differences (Figure S16).

Table S14. Evaluation of potential use of menstrual cup

Study	Location	Time	Design	Sample size and population	Menstrual cup	Outcome examined	Results	Comments
Averbach 2009 <sup>43</sup>	Epworth, Zimbabwe	2007-2008	Survey & FGD	43 adult women, 18-45 years, convenience sample from public clinics, markets and shopping centers	Duet (cervical cup, re-usable)	Consider use (Duet demonstrated but not tried by participants)	100% would try Duet for menstrual protection 76.7% would not be concerned if used for both menstruation and contraception 86.1% thinks it would make a difference to their lives 100% think the low cost and easiness to clean are important for trying 30% concerns about Duet getting lost inside	"Women felt that Duet potentially addressed the washing, drying and other hygiene issues they had with home products, as it is easy to wash with a small amount of water and soap, it can be immediately dried and reinserted, and thus is discreet."
Stewart 2009 <sup>46</sup>	Nottingham, UK	NR	Survey	69 patients attending a menstrual disorder clinic	Mooncup	Acceptability after reading information leaflet	20% had heard of cup. 38% would consider cup in future. One woman already used it. 69% mentioned perceived messiness as reason against considering mooncup, and 51% the need for washing between uses.	Higher potential use by age:  <30 years 3/18 (16.7%) 30-40 years 8/21 (38.1%)  >40 years 15/30 (50.0%) p = 0.04 (Fisher), <30 vs. >40  "Women who used tampons and described their menstrual flow as average to heavy were more likely to consider" (Data not presented)
Grose 2014 <sup>45</sup>	California, USA	NR	Survey: evaluation of water bottle (dummy) and menstrual cup by participants	151 female undergraduates	No particular brand	The relationship between self- objectification and attitudes toward an alternative menstrual product	33% knew menstrual cup. On scale 1-5 (1 = yes, 5 is no), mean 2.5 if asked if they would use the menstrual cup if it was given to them. 6% would use and 15 (9.9%) probably would use.	"higher levels of self- objectification were related to more negative attitudes toward one's menstruation, which was, in turn, negatively related to women's own probable purchase or use of the product, as well as overall negative reactions to it."
Borowski 2011 <sup>44</sup>	USA	2011	Survey and key person interviews	155 adult women, selected group related to author (80% white)	No particular brand	Awareness of environmental and health issues of menstrual products	69% not aware of eco-friendly feminine hygiene products Among 47/150 (31.3%) who were aware of eco-friendly products, 18 mentioned menstrual cups (38.3% or 11.6% overall). Advertisement and main stream marketing was considered important by participants for scaling up eco-friendly products	"The thing that keeps me from considering reusable products is the need to have to either emerge from a public toilet stall with blood on one's hands/a used cup or carry a soiled pad around in one's purse after use. I'm not sure how to solve these problems."

Abbreviations: FGD=Focus groups discussions.

Search term: [Country Name] menstruation information adolescents; Spanish: información para adolescentes menstru\* [nombre del pais]; Netherlands: Menstruatie informatie meisjes; German: Menstruation Information madchen; French: Premiere Menstruation information fille; Portuguese: informação para adolescents menstru\*

Disclaimer: This was a search to explore the mention of menstrual cup as an option to deal with menstruation, and not intended to be fully inclusive of all potential websites. We do not endorse any website.

<sup>†</sup> This pamphlet has information on the sponge for menstruation.

■ Menstrual cups ■ Disposable pads ■ Tampons ■ Reusable pads 100 80 60 40 20 0 Africa (6)

Figure S11. Menstrual items mentioned in education material on menarche, from 69 websites, 27 countries

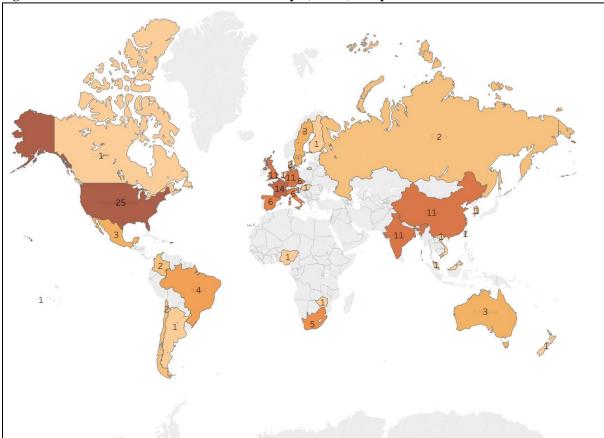

New Z.: New Zealand

For the methods see section 2; for a table of sources, see Table S15. The number of entries per region is in brackets. By region, disposable pads were mentioned in over 80% except for South America (43.8%); tampons were only in Europe, North America and Australia/New Zealand over 80%, whereas MCs were mentioned between 12.5% and 50.0%.

## Costs and availability

Using the Menstrual Cup Master List<sup>11</sup> and other sources, 199 brands were identified (in 35 countries, for 20 MCs country of origin unknown); purchasing prices and availability were retrieved for 145 brands (from 32 countries, for 4 MCs the country of origin unknown, Fig S12). These brands were available across 99 countries for purchase; availability of MCs was confirmed by web links or reports on shop sources (Fig S13). The purchasing price of one MC ranged from US\$ 0.72 (Chinese MC) to 46.72 (Danish MC); the median and average were 23.35 and 22.90 (prices by global region and country income level: Fig S14 & S15). Most MCs were made from silicone (98%), 1.4% from thermoplastic elastomer, and 0.6% from latex. Availability of MCs by web links or reports on shop sources was confirmed for 99 countries (Fig S18).

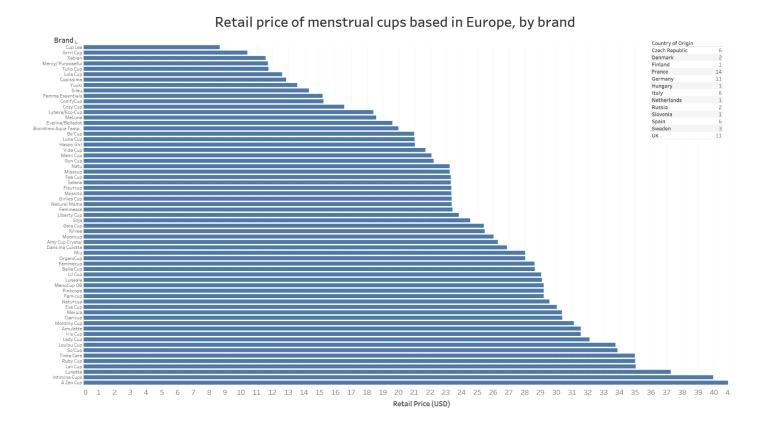

Source: Menstrual Cup Master List, data from 17 September 2018, supplemented with information obtained from experts in the field and web searches. The number in the country indicates the number of brands reporting to be based in that country. Only vaginal cups were included in this figure. We identified 145 menstrual cups with a price available: 141 originated from 32 countries (this map). For 4 menstrual cups the country of origin could not be retrieved.

Figure S13. Menstrual cup availability in 2018

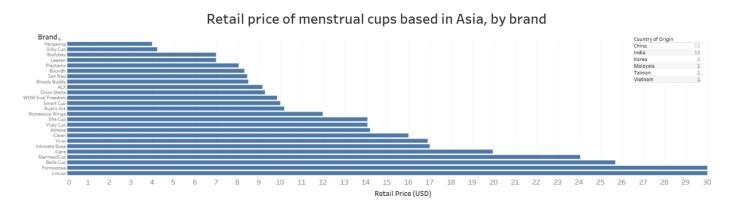

Note: In pink the 99 countries for which we could verify that one or more brands of menstrual cups could be obtained either through the web or in a shop. Only vaginal cups were included in the map. For methods see appendix page 4. Disclaimer: Our internet search may not reflect the local situation in each country.

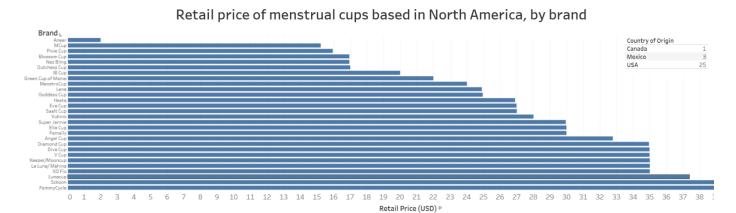

Figure S14. Retail price of menstrual cup, by brand S14A. Retail price of menstrual cups based in Europe, by brand (n=65)

## S14B. Retail price of menstrual cups based in Asia, by brand (n=26)

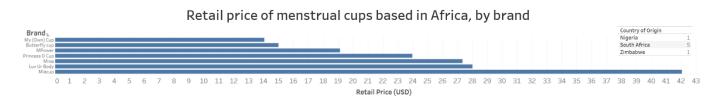

## S14C. Retail price of menstrual cups based in North America, by brand (n=29)

## S14D. Retail price of menstrual cups based in South and Central America, by brand (n=9)

## S14E. Retail price of menstrual cups based in Africa, by brand (n=7)

## S14F. Retail price of menstrual cups based in Oceania, by brand (n=5)

## S15B. Upper-middle income countries (n=28)

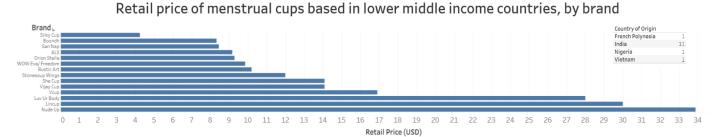

11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27 28 29

Retail Price (USD)

30 31

32 33 34 35 36 37 38 39 40 41

## S15C. Lower-middle income countries (n=14)

## S15D. Low income countries (n=1)

## Retail price of menstrual cups based in low income countries, by brand

The classification of countries is according to the Atlas method developed by the World Bank which sorts countries by Gross National Income per capita (https://data.worldbank.org/indicator/NY.GNP.PCAP.CD). The rankings applied are from 2017. Taiwan was aggregated with high-income countries, and French Polynesia with lower-middle-income countries. The distribution of brands across country wealth quintiles illustrates that menstrual cups are a luxury item most accessible to higher income populations.

yr: year.

Figure S16. Estimation of costs and waste of different products used for menstruation over 10 years

MC: menstrual cup. Note: Cost estimates of sanitary pads and tampons conducted in October 2018. Using accumulated estimates over 10 years, purchase costs of and waste from consistent MC-use (vaginal cup) would be a small fraction of the waste and purchase costs of pads or tampons: e.g. 5% and 7% of the purchase costs and 0·4% and 6% of the plastic waste when using 12 pads or tampons per period, respectively. Combined use of menstrual products during a period (e.g. panty liners for light days), the use of more than one cup over 10 years, inflation and production costs, and waste estimates were not taken into account in these calculations.

## 3. Web resources

## Blogs, forums and discussion platforms

We searched for supplemental information pertaining to the use, acceptability, and effectiveness of menstrual cups among the non-scientific community. Online blog, forum, and discussion platforms were assessed for relevance and for information not previously discussed in the primary scientific literature. These platforms were accessed using google searches and screened until saturation (3 pages without new references). Searches were conducted for adverse events relating to menstrual cups, including topics on menstrual cup retention, infection, and endometriosis.

Most entries surrounded the benefits of using menstrual cups, examining prices, environmental impact, and the changing narrative around menstruation. The discussion forums and blogs highlighted the nuances of insertion, wearing, and removal, as these processes were the areas where people experienced the most difficulty. Many women share their experiences online, with others offering advice and encouragement.

On a forum for menstrual cup support (menstrual\_cups.livejournal.com), one user describes intensified pain while using the DivaCup, only on specific days of her cycle. A responder explained that this pain may be due to suction of the cup on her cervix (due to the cup length). She is instructed to try flipping the cup inside-out to decrease the length and placement of the cup within the vagina. Another responder agrees and explains that the cervix changes in length throughout the cycle, which may affect the needed length of the menstrual cup. The firmness of the DivaCup is listed as a potential area for consideration, and alternative, less-firm menstrual cup brands are recommended.

Another forum entry, using the same platform as above, requests advice for inserting the cup. The initial poster explained she has experienced a lot of pain while attempting to insert the cup. Responders recommend different techniques for insertion, including relaxation, positioning of cup, different cup folds, and the use of lubrication. Additional responses recommend that if pain persists after trying the recommendations, the user should see a doctor for possible vaginal pain conditions, including vulvodynia. Serious adverse events are also discussed in blogs and forums. In the comment sections of a blog by Dr Jen Gunter (Toxic Shock Syndrome is also Related to Menstrual Cups), many cup users asked about symptoms and experiences. "Airstreamtatoo" commented that she experienced TSS as a result of using the Mooncup, even with regular washing and boiling. She later commented on the resulting discussion that the source of the bacteria was in uncleaned ventilation holes. The user stated that she did continue using a separate menstrual cup after the TSS case. This case has not been reported in a scientific publication. The discussion on TSS was developed further in a blog titled "Menstrual Cups are More Likely to Cause Toxic Shock Syndrome than Tampons." This blog cites research from the University Hospital of Lyon which claims that menstrual cups are more likely to cause TSS than tampons due to the fact that they allow more air into the vagina. Additionally, since they are not removed as frequently as tampons, the researchers claim this allows for a greater opportunity for bacteria growth. This may be referring to the paper by Nonfoux et al. 54, which used an in-vitro model to examine the development of S. aureus and toxins with cups and tampons. However, it is not clear how applicable this in-vitro model is to the "real-life" situation, presented in other papers showing no difference between groups using a variety of products.

Though many of the broad benefits and problems associated with menstrual cups are discussed in scientific publications, the specific conversations and nuances of cup use on websites can provide critical insight into user experiences and can highlight issues missed by researchers. These platforms are able to reach individuals around the world, enabling a wide diversity of individuals to ask questions or provide responses.
