

Supplementary Figure S4

Supplementary Figure S4. Labile ctHPV16DNA clearance kinetics in patients with low (≤ 200 copies/mL) baseline ctHPV16DNA levels. Normalized ctHPV16DNA levels for patients with low pre-treatment ctHPV16DNA levels, defined as ≤ 200 copies/mL (N=27). Due to the notably complex clearance kinetics for these patients, the analysis of Week 4 ctHPV16DNA clearance was restricted to patients with >200 copies/mL at baseline.
