2

3 **Table S1:** A list of the soil and site characteristics for each of the 143 soil samples. This table

4 also contains 16s rRNA and hsp65 amplicon read counts per sample, and the percent relative

5 abundance of reads assigned to the *Mycobacterium* genus as determined by the 16S rRNA gene

6 analyses. Abbreviations are as follows: *Clay* = *Clay+Silt (%)*; *OC* = *Organic carbon (%)*; *TN* = *Total*

7 *nitrogen (%)*; *TPmgKg*=*Total phosphorus (mg P Kg)*; *CN* = *Carbon:Nitrogen ratio*; *pHwater* = *pH*;

8 *AridityIndex* = *Aridity Index*; *MDR* = *Mean diurnal temperature range (°C)*; *MAXT* = *Maximum*

9 *temperature (°C)*; *MINT* = *Minimum temperature (°C)*; *PSEA* = *Precipitation seasonality*; *UV*=*UV*

10 *light*; *NPP20032015* = *Net primary productivity (NDVI index)*; *Ecosystem* = *Ecosystem type*;

11 *ElectricalConductivityuScm* = *Electrical conductivity (μS cm)*; *Myco_16S_relabun* = *mycobacteria*

12 *relative abundance*; *16S_reads* = *16S reads (pre-ordination)*; *hsp65_reads* = *hsp65 reads (pre*

13 *presence/absence category*).

14 (separate attachment)

23 **Table S2:** A table of Pearson correlations between pairs of each environmental variable
 24 measured. For abbreviation definitions, see Table S1.

26 **Table S3:** Output of Random Forest Models identifying environmental variables important for
27 predicting distributions of the *Mycobacterium* genus as well as the top 20 most ubiquitous
28 mycobacterial lineages. The table includes the percent variation described by the model overall
29 as well as the importance of the top 4 environmental predictors. For abbreviation definitions,
30 see Table S1. Four of these mycobacterial clades included described members: **Clade 10** (*M.*
31 *stomateiae* DSM 45059 T, *M. genavense* DSM 44424 T, *M. florentinum* DSM 44852 T, *M.*
32 *lentiflavum* CIP 105465 T, *M. montefiorens*e DSM 44602 ATC, *M. triplex* ATCC 700071 CIP 106);
33 **Clade 12** (*M. novocastrense* CIP 105546 T, *M. rutilum* czh-117 T); **Clade 31** (*M. arosiense* DSM

94 **FIGURE S1:** Map of soil sampling locations across the globe (n=143). Darker dots represent
95 overlap of nearby sampling sites.

96

97

98 **Figure S2: The top twenty most abundant named genera across 143 soil samples, ordered by**

99 **average relative abundance.** Dots represent the relative abundance of each genus per
100 individual sample, as identified by 16srRNA gene sequencing. The dot color represents the
101 phylum-level classification of each genus. The relative abundance of mycobacteria ranges
102 from 0.03% to 2.9% with an average of 0.52%, making it the 12th most abundant genus on
103 average.
