

Supplemental Information

CAG Repeat Not Polyglutamine Length

Determines Timing of Huntington's Disease Onset

Genetic Modifiers of Huntington's Disease (GeM-HD) Consortium

Supplementary Tables

Table S1 – HTT canonical and non-canonical DNA sequence variations in HD individuals and controls – related to Figure 2

The frequencies of DNA sequence variations immediately downstream to the uninterrupted *HTT* CAG repeat on expanded (>35 CAGs) and normal (<36 CAGs) chromosomes are given, classified as canonical (CAG repeat followed by a single CAACAG codon pair) and non-canonical (CAG repeat followed by all other sequence variations). A total of 1,980 sequences were determined by MiSeq DNA sequence analysis of 990 unique HD study individuals (17 without an expanded repeat) not having minor alleles for either of the chr 4 SNPs rs764154313 and rs183415333. Augmenting these results, a total of 9,486 sequences were observed in a large non-HD study sample of 4,738 unique individuals, as determined by analysis of whole genome sequence data. In the total of 11,456 chromosomes (986 with expanded CAG repeats and 10,470 with normal range CAG repeats), more than 95% of both expanded and control chromosomes had the canonical single penultimate CAA interruption, followed one of twenty-six different downstream sequence variations. The great majority of these canonical chromosomes matched the reference sequence (GRCh37/hg19): CAA1 CAG1 CCG1 CCA1 CCG7 CCT2 CAGCTTCCT1, or the common polymorphic variant: CAA1 CAG1 CCG1 CCA1 CCG10 CCT2 CAGCTTCCT1. The non-canonical sequences comprised twenty-one different sequence variations. A number of canonical and non-canonical sequence variations featured codon differences that alter the proline-rich amino acid sequence that follows the polyglutamine tract. On canonical chromosomes, two infrequent sequence variations exhibited a TCG serine or a ACG threonine residue amidst the proline codons. On four rare non-canonical sequence variations the CAG repeat was followed by a CAC histidine codon. One of these also featured a CGC arginine codon. Yet another non-canonical sequence displayed a CTA leucine codon and an ACG threonine codon. Neither frame-shift codons nor stop codons were observed in this large set of chromosomes.

Table S1 – HTT canonical and non-canonical DNA sequence variations in HD individuals and controls – related to Figure 2

Sequence adjacent to uninterrupted CAG repeat	HD Expanded (>35 CAG) chromosome (number)	HD Expanded (>35 CAG) chromosome (frequency)	HD Normal (<36 CAG) chromosome (number)	HD Normal (<36 CAG) chromosome (frequency)	Non-HD Expanded (>35 CAG) chromosome (number)	Non-HD Expanded (>35 CAG) chromosome (frequency)	Non-HD Normal (<36 CAG) chromosome (number)	Non-HD Normal (<36 CAG) chromosome (frequency)

Table S3 –Enrichment in GWA12345 of pathways from GWA123 – related to Figure 1 and Table 1

Pathway enrichments relative to those reported in GWA123 (GeM-HD Consortium, 2015) are shown, for the original CAG genotyping-based GWA12345 dataset, from a “self contained analysis” measuring overall association among genes in a pathway, a “competitive” analysis measuring association in genes within a pathway to those outside the pathway and analysis with ALIGATOR to test whether pathways contain a larger number of “significant” genes than expected by chance, given the number of SNPs they contain.

Table S3 –Enrichment in GWA12345 of pathways from GWA123 – related to Figure 1 and Table 1

Table S6 – Enrichment across 14,210 pathways – related to Figure 1

Significant enrichments (self-contained analysis) in 14,210 pathways containing between 10 and 500 genes from the Gene Ontology (GO), Kyoto Encyclopedia of Genes and Genomes (KEGG), Mouse Genome Informatics (MGI), National Cancer Institute (NCI), Protein ANalysis THrough Evolutionary Relationships (PANTHER), BioCarta and Reactome.

Table S6 – Enrichment across 14,210 pathways – related to Figure 1
