

Figure S1. Exemplary GM weight map for age regression during maturation in RVR. To exemplarily illustrate the most important GM features that were used by the RVR for estimating the age in childhood and adolescence based on structural MRI data, weights below the 5th and above the 95th quartile are displayed, overlaid on the normalized mean image of the sample. Color scale indicates the weight. [Figure and legend reproduced from (Franke et al., 2012), with permission from Elsevier, Amsterdam.]
