

Supplemental Figure 1. Comparable fungal loads in wildtype, ficolin-A knockout (KO), and ficolin-B KO mice following *A. fumigatus* infection. Wildtype, ficolin-A KO and ficolin-B KO mice were intranasally inoculated with 2×10^7 *A. fumigatus* conidia. Mice were sacrificed 24 hours post-infection for quantification of fungal load (CFU/lung) in whole lung homogenates. Results were obtained from two independent experiments (n=4-6/group in each experiment).
