Fig.R1.

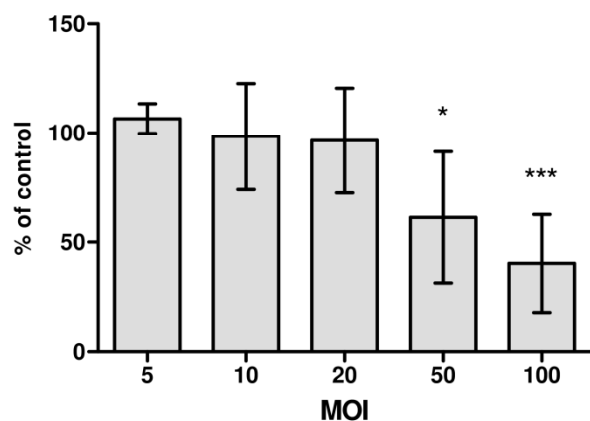

Fig.R1. The influence of *E. coli* on hMDMs viability. The macrophages were infected with different MOI ranging from 5 to 100 for 4 h, then MTT cytotoxicity assay was performed. The viability of *E. coli* infected hMDMs is presented as the percentage of non-infected control hMDMs, which were considered to be 100%. Data represent mean values \pm SD calculated from the results of three - six independent experiments using hMDMs derived from different donors. *, $p < 0.05$; ***, $p < 0.001$;
