Discovery cohort

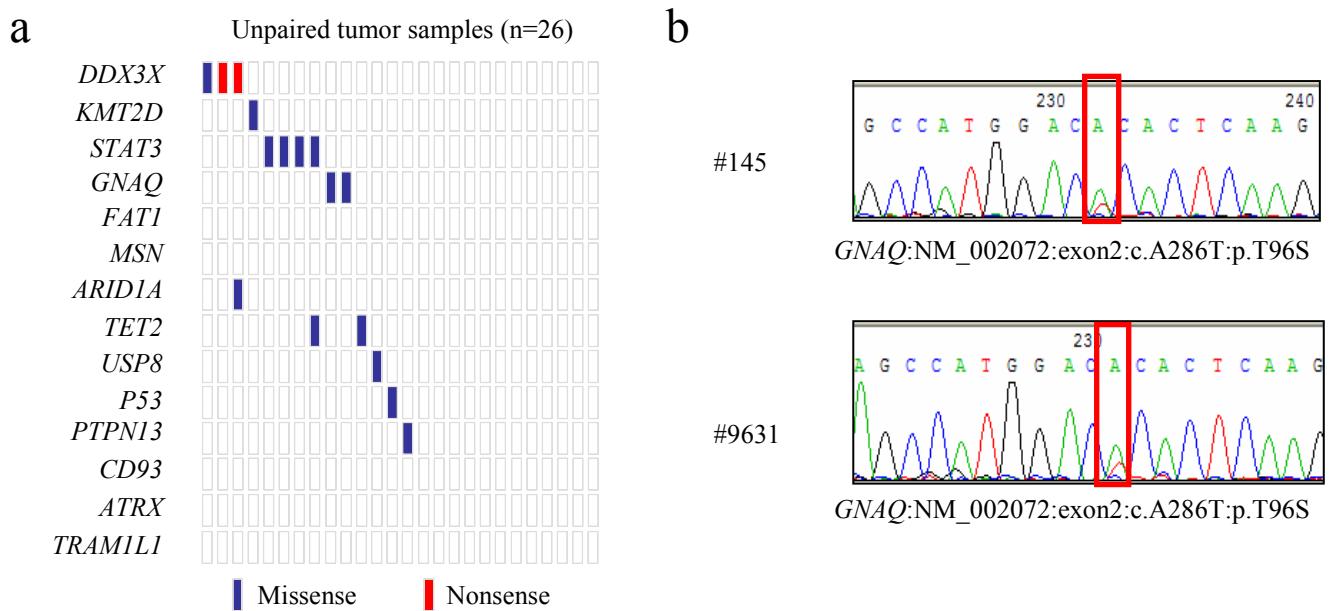

Supplementary Fig. 1 Experimental design. A combination of whole-exome sequencing ($n=28$) and targeted deep sequencing ($n=73$) was performed on a total of 101 NKTCL pairs. The recurrently mutated *GNAQ* T96S mutations were identified, and these mutations were further validated in a cohort of 26 NKTCL samples without matched normal tissue. Functional studies of *GNAQ* (wild-type and mutants) were performed, and the altered downstream signaling pathways were examined. Moreover the associations between *GNAQ* T96S mutations and prognosis were assessed.

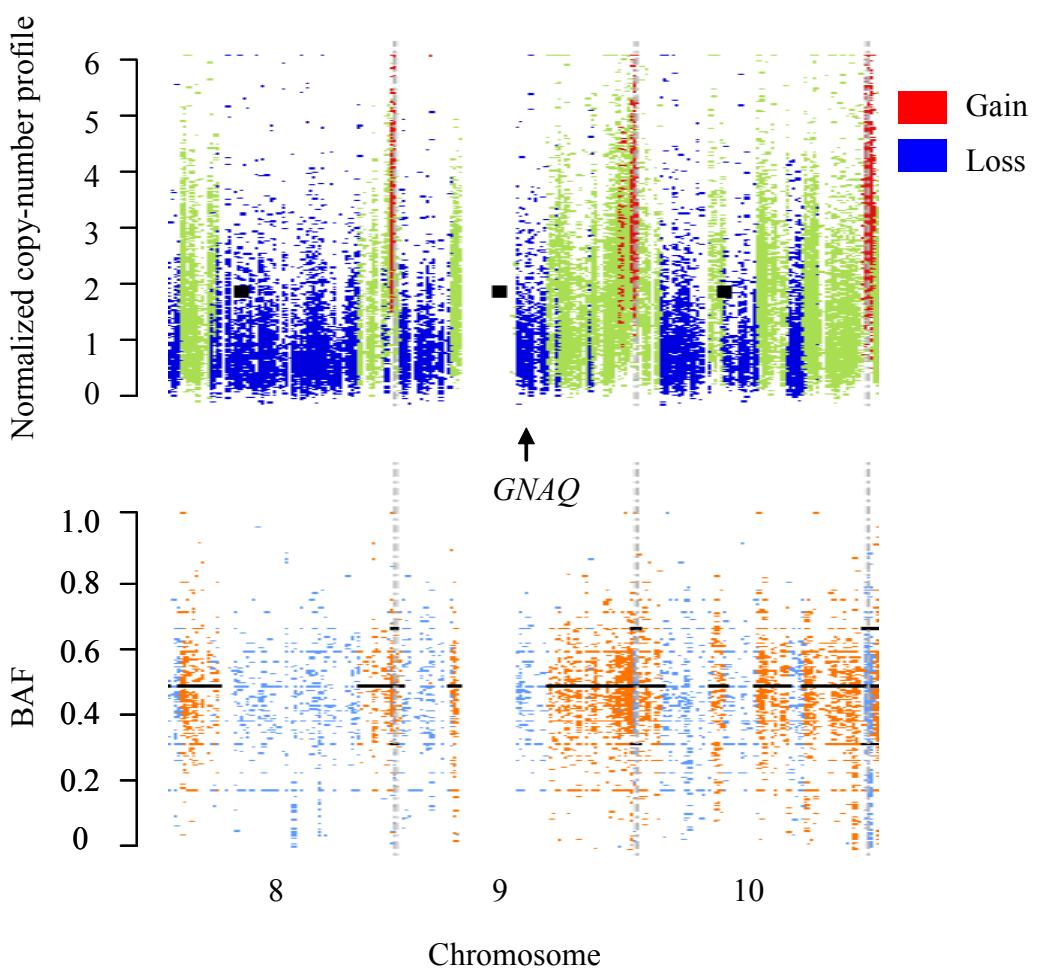

Supplementary Fig. 2 The correlation of somatic nonsilent mutation burden and age in NKTCL patients ($R^2=0.295, p=0.004$) after excluding the two patients with more than 200 mutations.

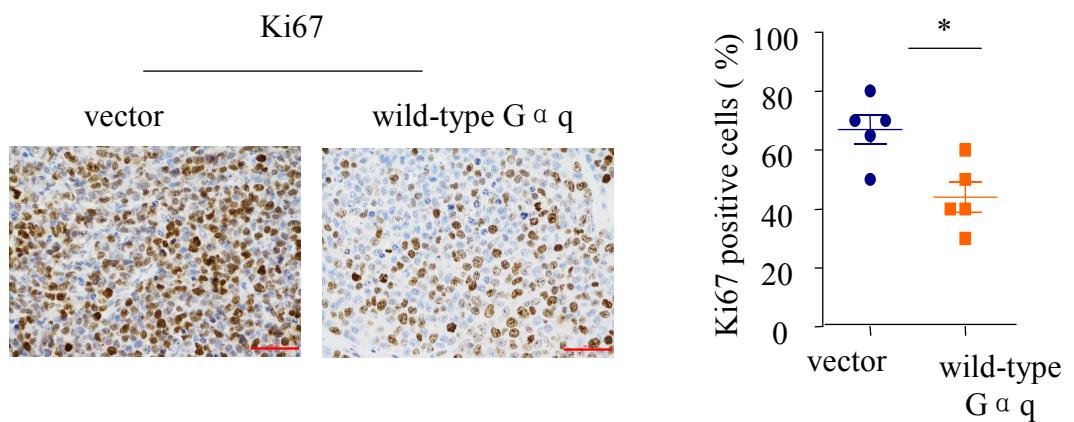

Supplementary Fig. 3 Fifteen point mutations in *GNAQ* were identified in 11 NKTCL samples: 9 mutations encoding T96S, 4 mutations encoding Y101X, and one mutation encoding p.K57T, and one mutation encoding p.M59L. Mutations in T96S cooccurred with Y101X and p.M59L in 3 cases and one case, respectively.

Supplementary Fig. 4 Validation of the frequently mutated genes in an independent cohort of NKTCL (n=26) with no matched normal tissue. **a** Mutation status of the 14 frequently mutated genes in this cohort. **b** Validation of *GNAQ* T96S mutations in two NKTCL patients (#145 and #9631) by Sanger sequencing.

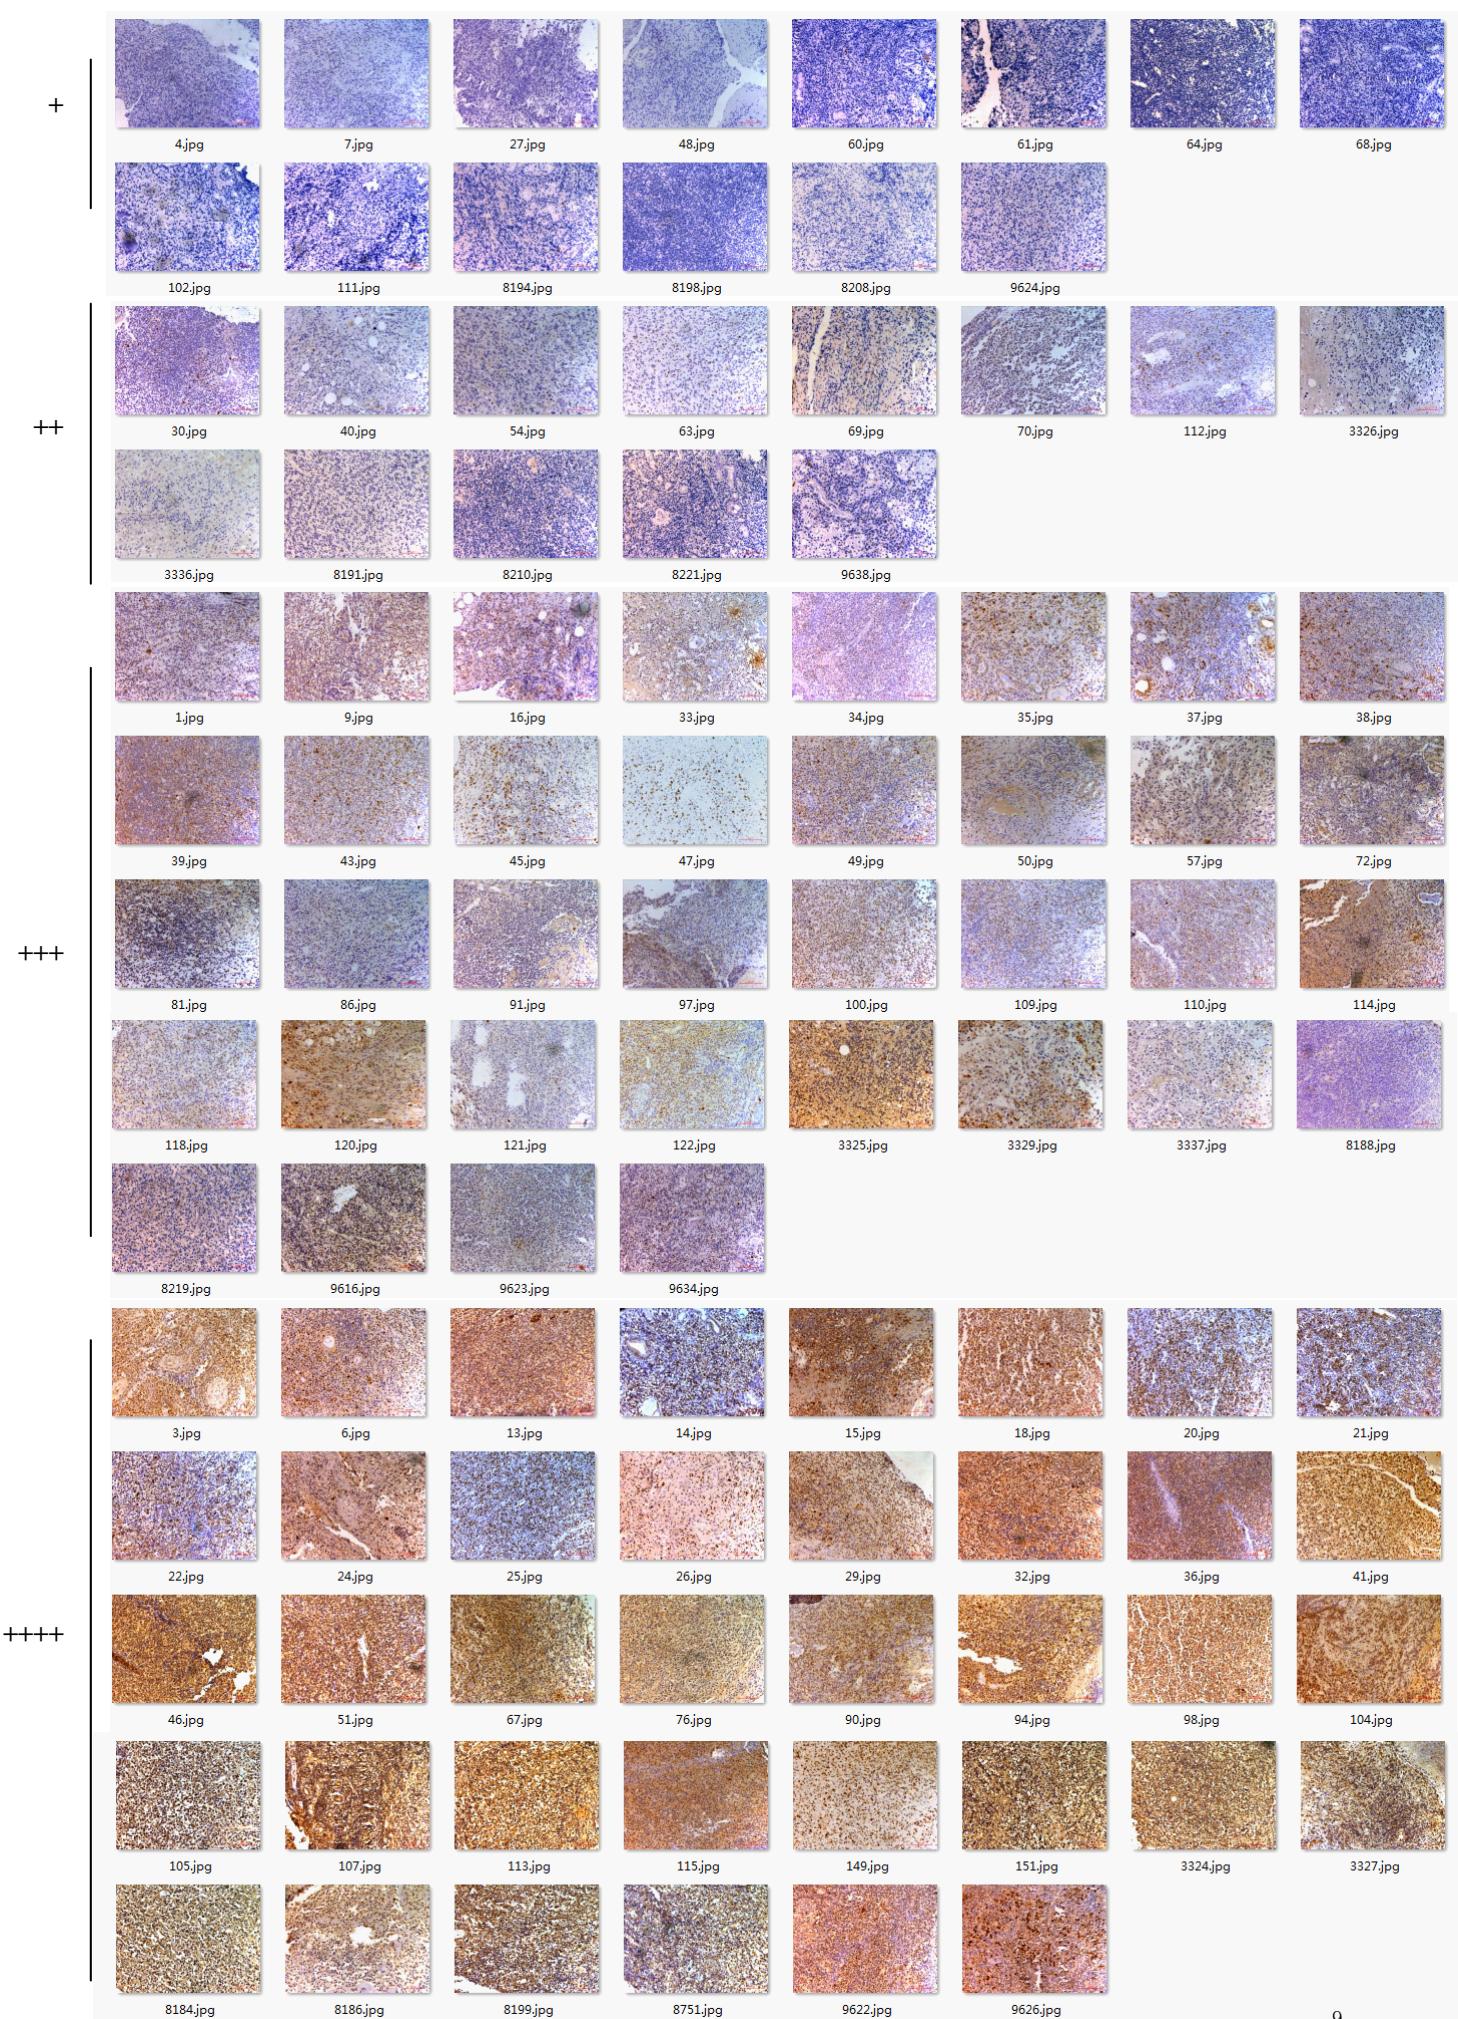

Supplementary Fig. 5 Control-FREEC calculates copy number and BAF profiles and detects regions of copy number gain/loss.

Supplementary Fig. 6 Representative images and quantitative data for Ki67 staining of xenograft tumor tissues. Data are expressed as the mean \pm s.e.m.; scale bars, 50 μ m. * <0.05 . Source data are provided as a Source Data file.

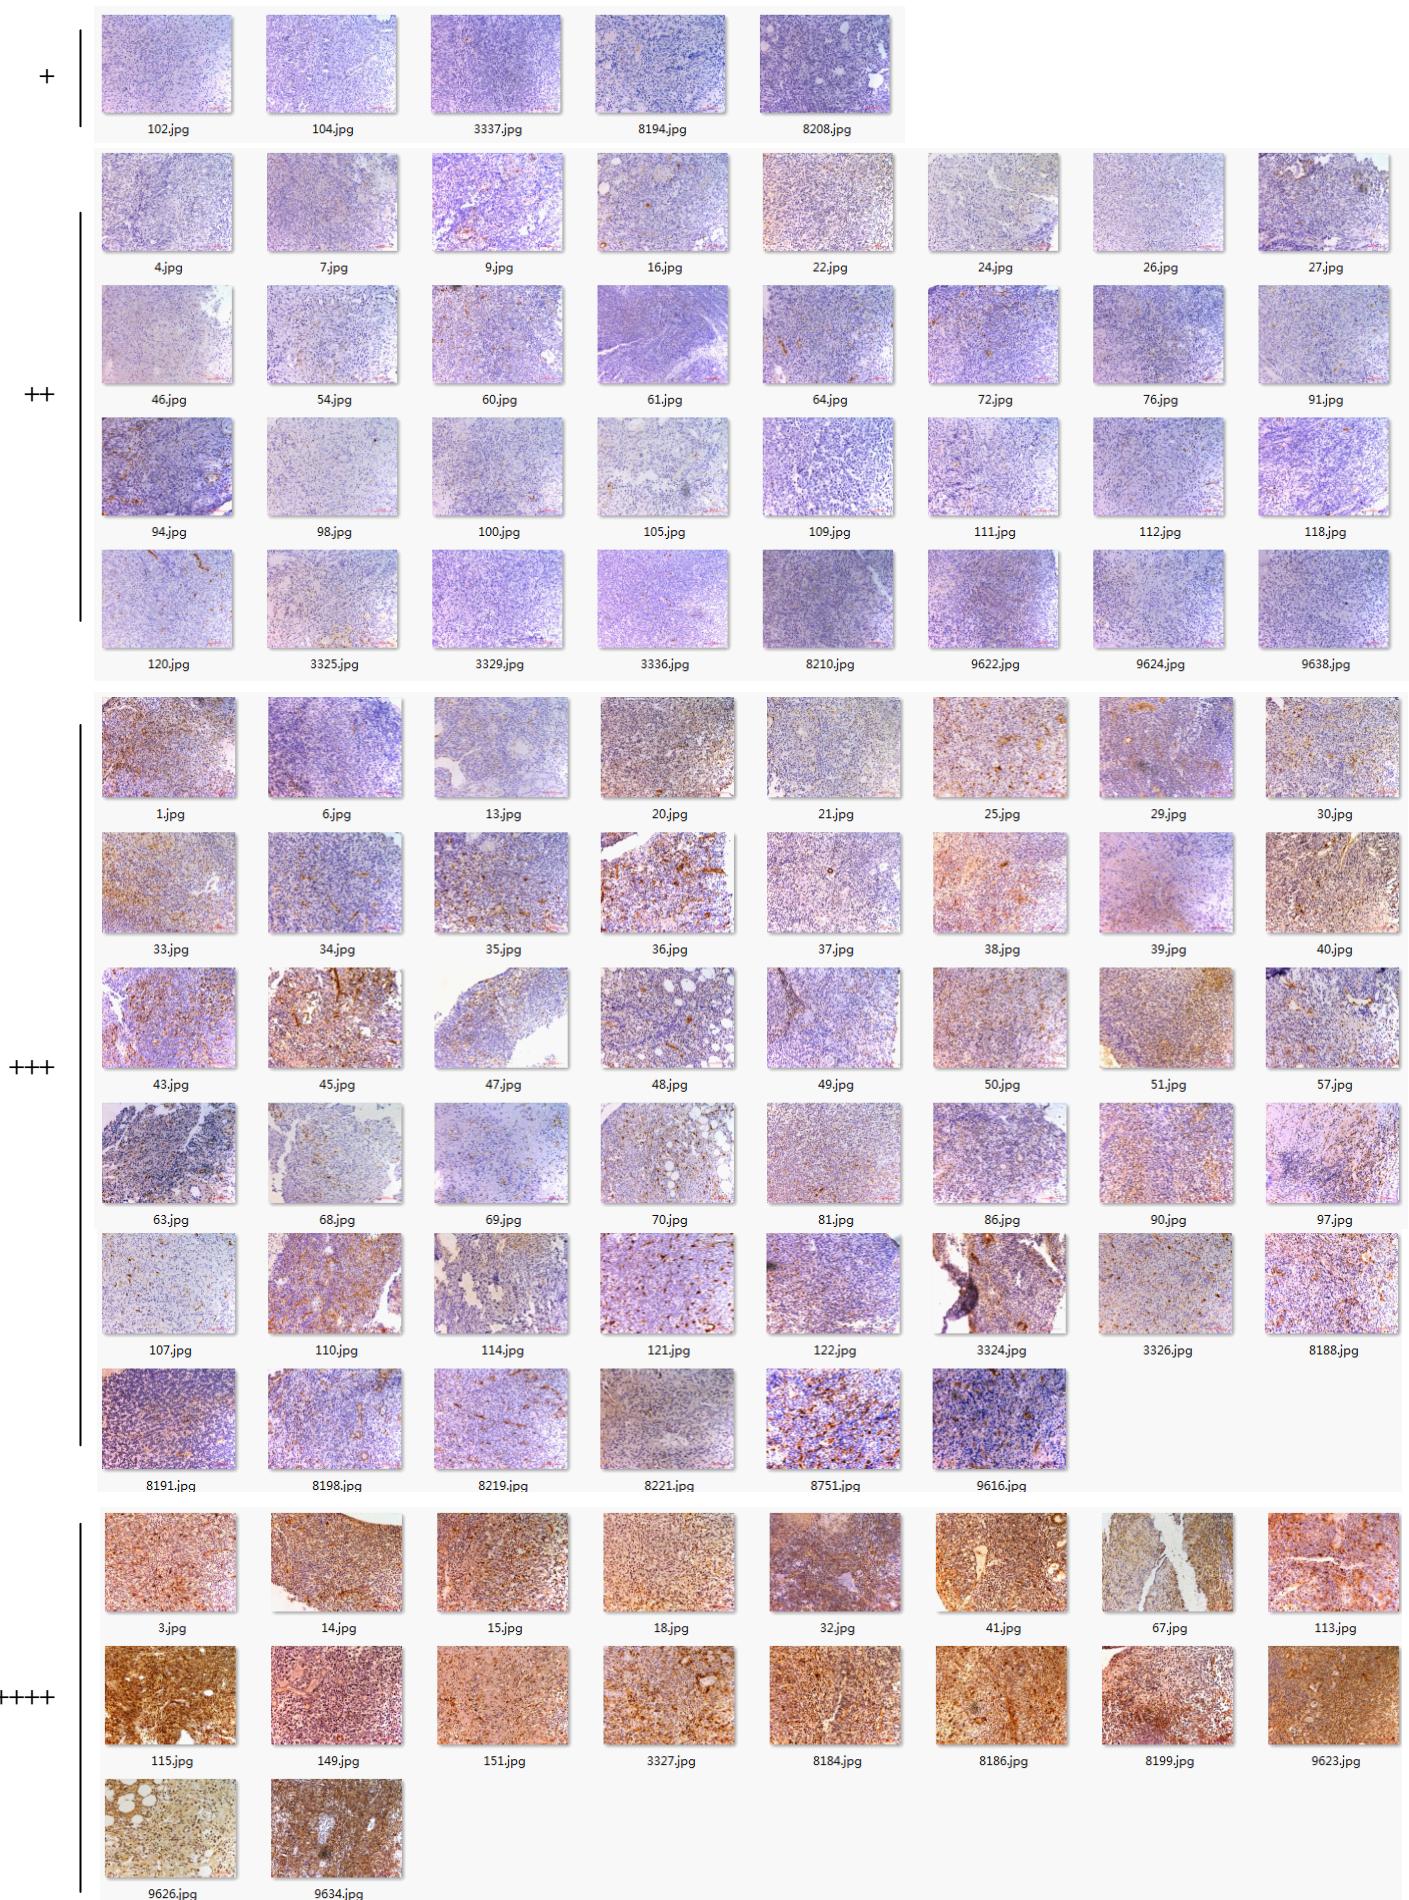

a

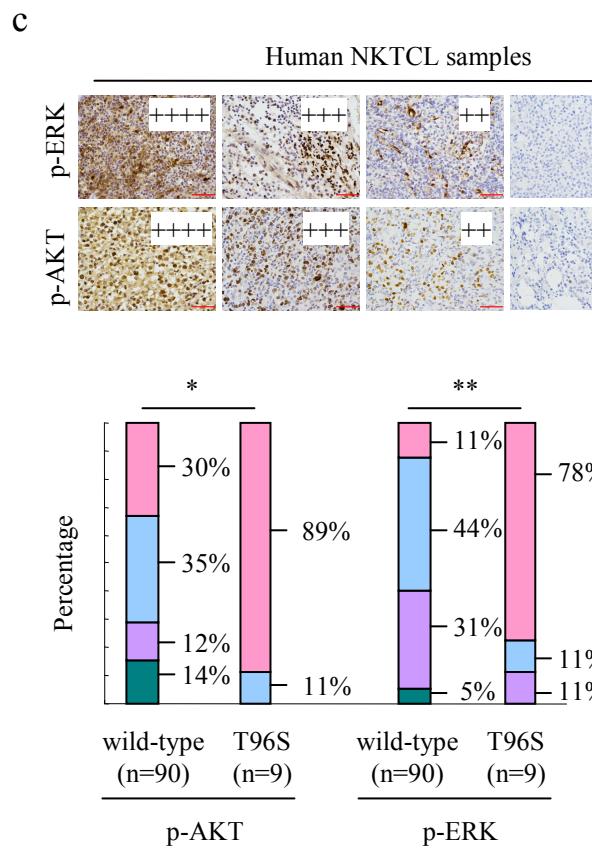

p-AKT

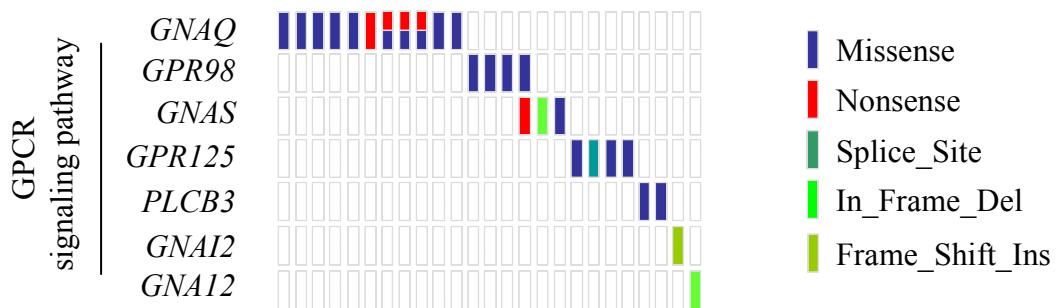

b

p-ERK

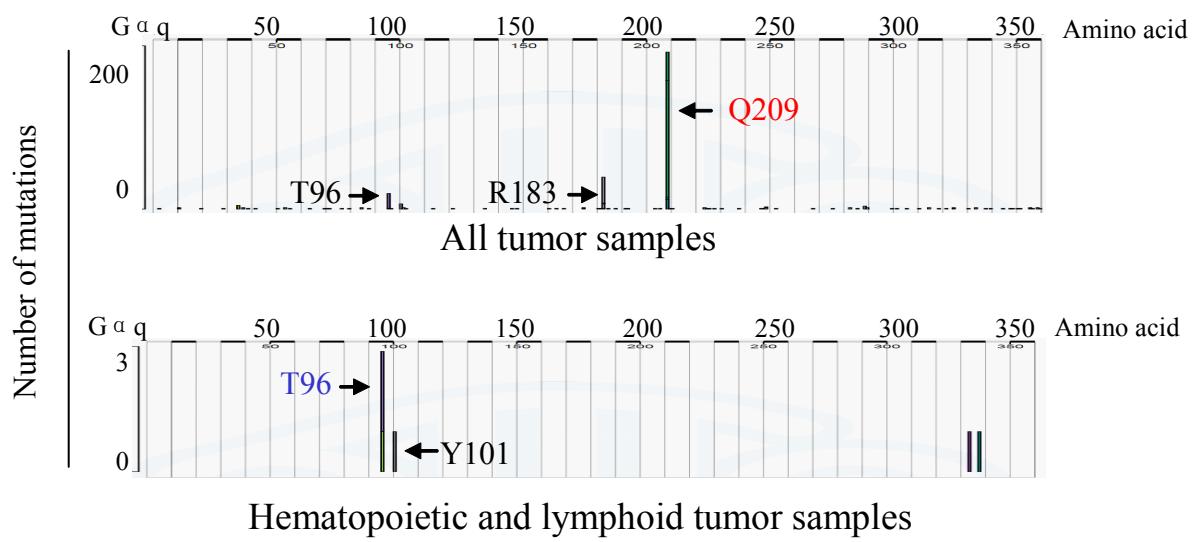

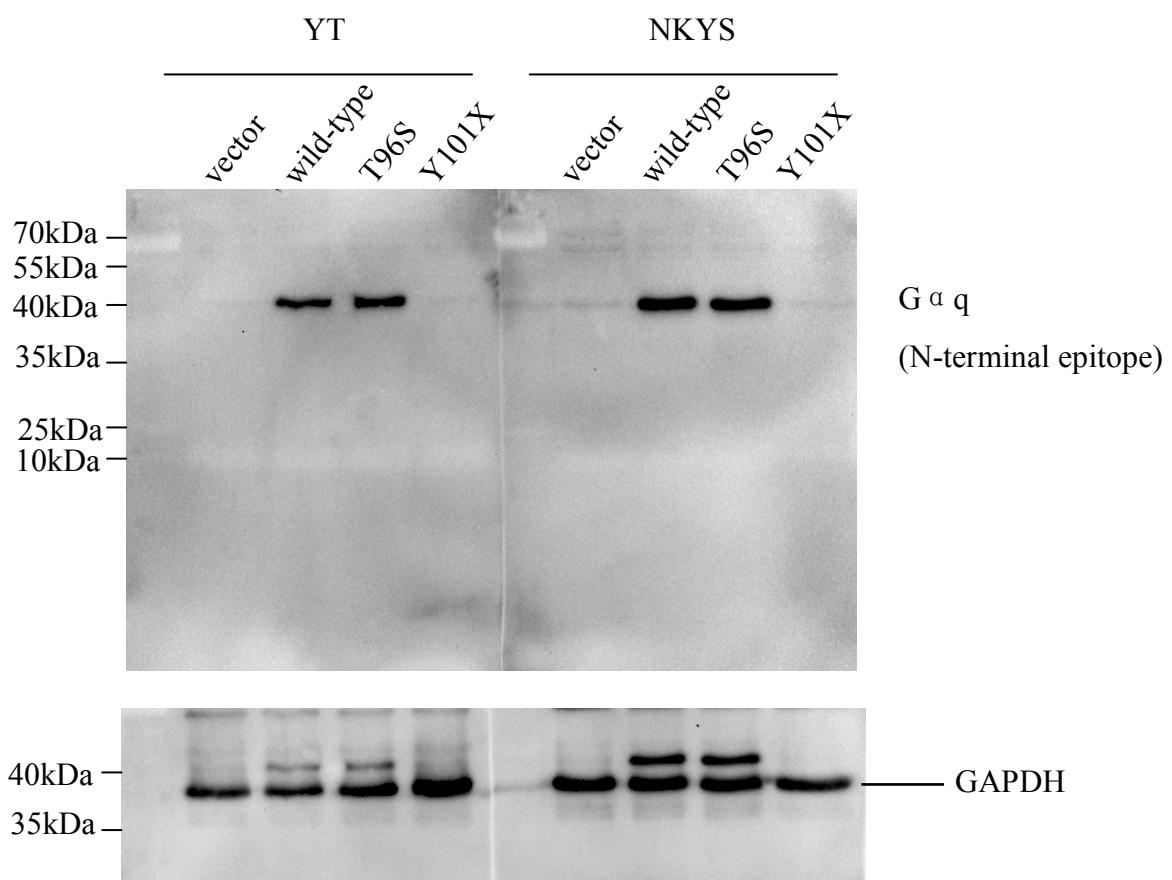

Supplementary Fig. 7 Immunohistochemical staining results of phospho-AKT (**a**) and phospho-ERK (**b**) in human NKTCL samples with wild-type (n=90) and T96S mutant (n=9). The expression levels of phospho-ERK and phospho-AKT were scored semiquantitatively according to the percentage of IHC-positive cells: +, 0%; ++, 1–10%; +++, 11–50%; or +++, >50%. *p* values were calculated using a two-sided Fisher's exact test (**c**). Scale bars, 50 μ m. **p*<0.05, ** *p*<0.01.

Supplementary Fig. 8 Heat map of genes in the commonly mutated GPCR signaling pathway in NKTCL. Each row represents a mutated gene. Each column represents a patient sample. Blocks are color coded by the functional type of mutation.

Supplementary Fig. 9 The most common sites of *GNAQ* mutations identified in different tumor tissues in the COSMIC database.

Supplementary Fig. 10 Western blot analysis of G α q Y101X mutant expression in YT and NKYS cells.

Supplementary Table 1. Demographics and clinical features of 127 subjects with NK/TCL.

*Significance Analysis of INTeractome (SAINT) expression was utilized to calculate the probability of protein-protein interaction from background, nonspecific interactions with a SAINT probability threshold of ≥ 0.8 . The five proteins (ANXA2, TUFM, HSP70B, RPL14 and EEF1A1) showed SAINT probability scores of < 0.8 for one of the baits, suggesting that their binding is influenced by the presence/absence of the T96S mutation.
