

**Figure S1. qPCR analysis of fibronectin, EDA+ fibronectin and EDB+ fibronectin mRNA levels in EV, WTβ3 and CAβ3 TM-1 cells.** Levels of fibronectin mRNA were higher in WTβ3 and CAβ3 cells than EV cells (both  $p < 0.01$ ). Levels of EDA+ fibronectin or EDB+ fibronectin mRNA were not significantly different among the three cell lines. Data were pooled from three separate analyses and represent the mean  $\pm$  SE. Results were normalized to the housekeeping gene SDHA.
