

Figure S3. MTT assay analysis of potential FUD-induced cytotoxicity in EV, WT β 3 and CA β 3 cells. Cells were left untreated or were treated with 500 nM or 2 μ M FUD or 0.1% saponin for 24 hr prior to processing. FUD had minor, statistically significant cytotoxicity on EV and WT β 3 cells at both concentration (all $p < 0.02$). FUD had no significant cytotoxicity on CA β 3 cells. Results are pooled from three separate assays with triplicate determinations ($n = 9$) and represent the mean \pm SE.
