

Supplementary Table S1.

Hierarchical clustering of correlation values (Spearman score) of the 312 ZEB1-correlated genes (rows, selected for $r \geq 0.5$ with ZEB1) with SNAI1, NFATc2, CDH2, AXL, MITF and CDH1 (columns).

Positive scores are highlighted in red, negative scores are highlighted in blue.

Data were retrieved from the TCGA melanoma dataset at www.cbiportal.org.

Legend to Supplementary Table S2 A,B. Whole genome gene expression analysis of NFATc2_shRNA_86a and of two control transfectants (control shRNA_1 and _2) from Me71 was carried out as described in ref. 35, by single-color hybridization of RNAs performed on Illumina Bead Chip HumanHT-12_v4 Microarrays (Illumina). The expression profiles have been deposited in NCBI's Gene Expression Omnibus (GEO) with GSE accession number GSE101323. Differentially expressed genes in NFATc2 shRNA_86a transfector compared to control-shRNA_1 (A) and control-shRNA-2 (B) transfectants were identified as described in ref 35 by BRBarray Tools (Vers.4.3.0) software. Ingenuity Pathway Analysis (IPA 8.5, www.ingenuity.com) was used to carry out "upstream regulator analysis" on differentially expressed genes. Upstream regulator analysis allows to identify the upstream transcriptional regulators that can explain the observed gene expression changes in the dataset. This computational tools returns results based on pvalues and Z score statistics. P values indicate the likelihood of the overlap between the genes in the dataset and those that are regulated by a predicted transcription factor. Negative Z score statistics (only those <-2 are considered significant and shown) are used to infer the "inhibited" the activation states of the predicted transcription factors.
