

1 **Supplemental data**

2 **Methods**

3 **Cell culture:** U2OS, SAOS-2 and SJSA-1 cells were obtained from ATCC, while HuO-3N1 and
4 HuO9 were from the RIKEN Institute. Canine OS cell line OVC-cOSA-31 was established in
5 University of Guelph. Cells were cultured according to the provider's specific protocol. Viable
6 cell quantifications were done using Celltiter-Glo or hemocytometer.

7 **Real-time PCR:** Genomic DNA was isolated from human osteosarcoma tissues using DNeasy
8 Mini Kit (Qiagen). Real-time PCR was carried out using Perfecta SYBR Green Super mix
9 (Quantabio) according to the manufacturer's protocol using Applied Biosystems 7500 PCR
10 system. Human genomic DNA (Promega) was used as the control sample. The PCR primers used
11 here were as follows: DLG2-F: 5'-TGTTGAGGATGTGGTGGAGA-3', DLG2-R: 5'-
12 TTGTACTGGCCGGCTTCTAT-3'; RRP30-F: 5'-GCAAGTAAGTTCTCCGAATCC-3', RPP30-R: 5'-
13 GCGCAGAGCCTTCAGGT-3' (internal control). Relative copy number was compared to control,
14 and calculated as $2^{-\Delta\Delta CT}$. Value less than 0.5 was determined as deletion.

15 **Lentiviral transduction:** DLG2 open reading frame expression (EX-Z6752-Lv201) and empty
16 control clones were obtained from Genecopoeia. Lentivirus was produced using Lenti-Pac HIV
17 Expression Packaging kit (Genecopoeia). To generate stable cell lines, osteosarcoma cells were
18 transduced with the indicated lentiviruses (MOI = 10~20) and selected with 1 µg/ml puromycin.

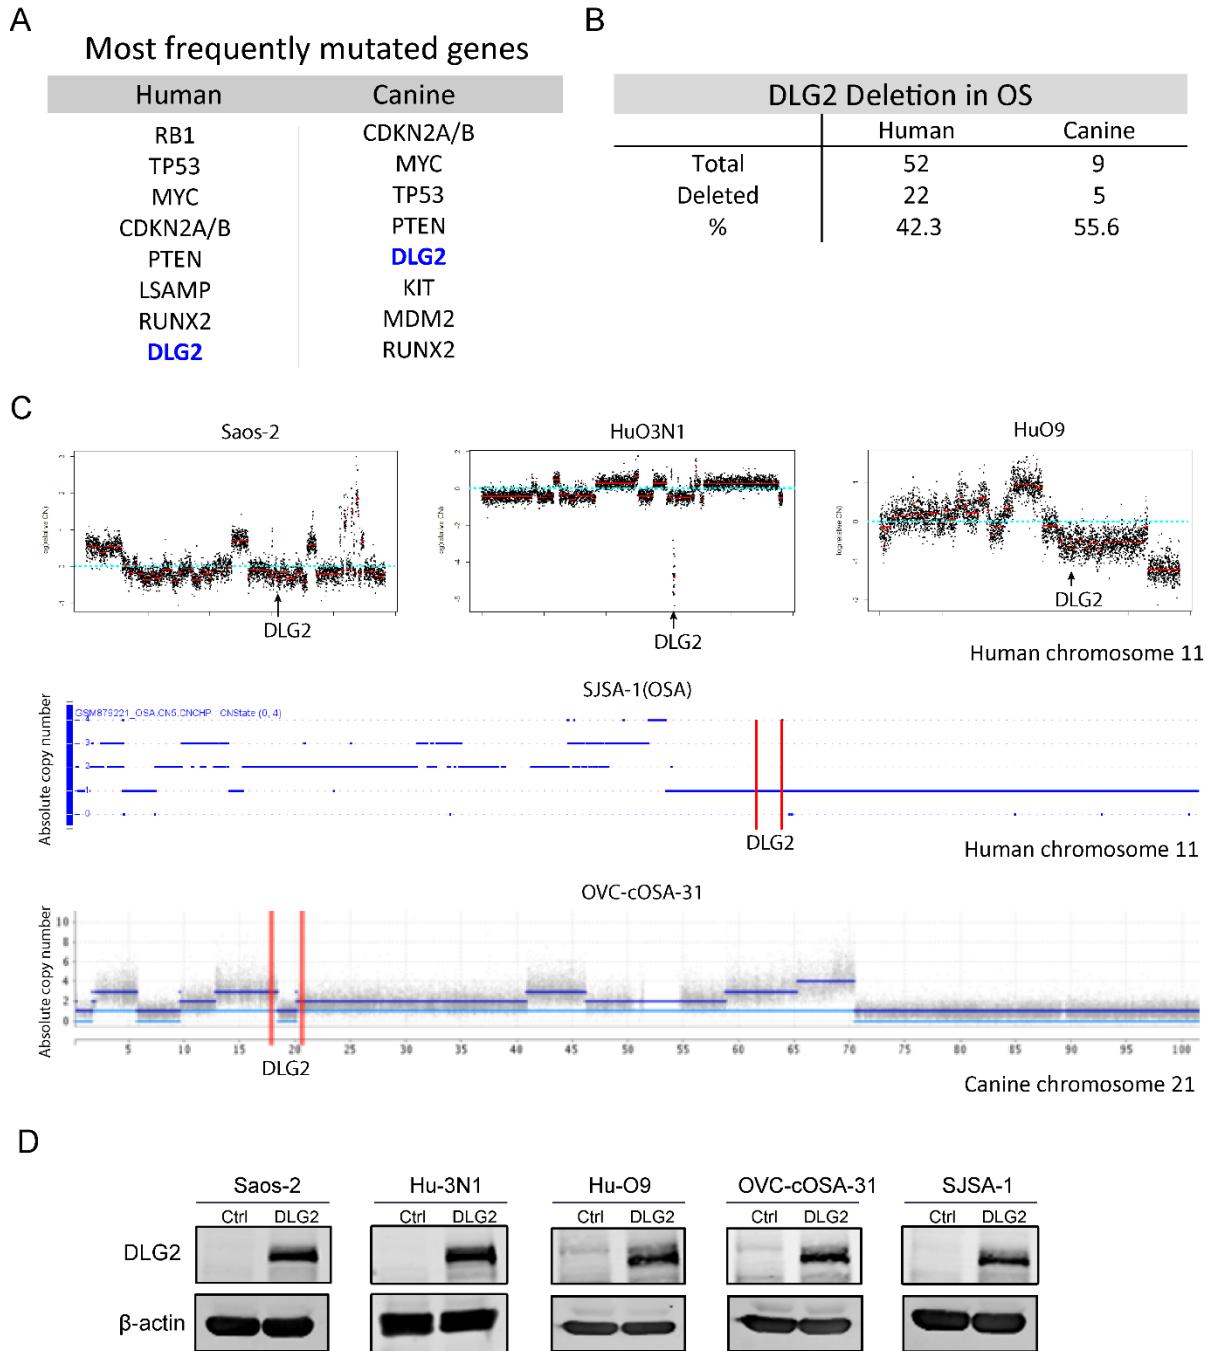

19 **Western blot:** The analysis was performed by standard procedures. Antibodies against DLG2
20 (1:1000, AB5168-200UL, Millipore) and β-actin (1:1000, #3700, Cell Signaling Technology) were
21 used. The protein bands were detected by the enhanced chemiluminescence detection system.

1 **3D Matrigel colony formation assay:** 200 μ l of Matrigel (BD Biosciences) was added to each
2 well of a 24-well tissue culture plate and allowed to solidify for 1 hour at 37°C. 2X10⁴ cells were
3 suspended in 200ul 20% Matrigel in culture medium and seeded onto Matrigel-coated wells in
4 triplicate. Plates were then incubated at 37 °C for 30 min to allow the Matrigel to solidify, and
5 culture medium then was added. Cells were allowed to proliferate for 2–3 weeks and to form
6 colonies. These were imaged and quantified under a phase-contract microscope.

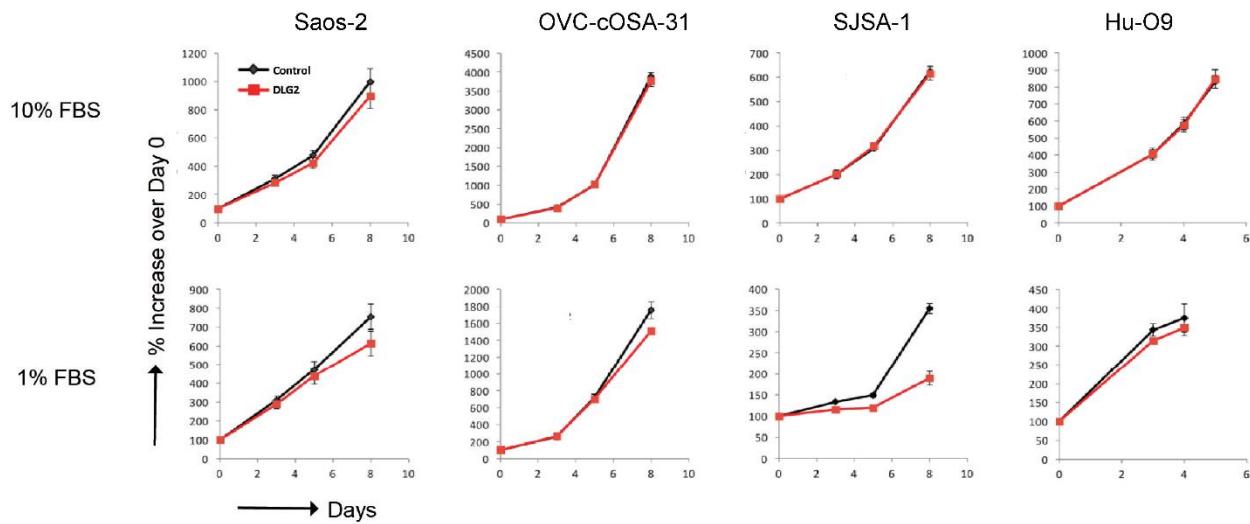

7 **Scratch-wound and transwell migration assay:** Scratch-wound assays were carried out
8 according to standard protocols. Cells were cultured for 24 hours to monitor migration. The gap
9 distance was quantitatively evaluated using Image J software. Transwell migration assays were
10 carried out on 24-well transwell insert (BD Biosciences), 10% FBS was used as an attractant
11 and cells were then cultured for 24 hours.

12 **Histology and immunohistochemistry:** Organs or tumor samples were dissected, washed
13 thoroughly with PBS, fixed with 4% paraformaldehyde (PFA) overnight at 4°C, decalcified in 20%
14 EDTA (pH 7.4), and then embedded in paraffin. Sections (5 μ m) were prepared and stained with
15 hematoxylin & eosin (H&E) or Masson-Trichrome by Toronto Centre of Phenogenomics (TCP)
16 pathology laboratory via routine protocols.

17 **Cell cycle analysis by flow cytometry:** BD Pharmingen BrdU Flow Kits and in-house flow
18 cytometry protocol were followed. Briefly, BrdU was added to cells at a final concentration of
19 10 μ M for 1-3 hours depending on the cell line. Flow cytometry preparation was performed
20 using standard protocols. Data collection was done on BD Fortessa II and analysis was done
21 using FlowJo Version 7.65 or Version VX.

Supplemental Figure 1. (A) 6 of the 8 most frequently altered genes in osteosarcoma are common to both human and dog. Note DLG2 is among the top genes in both species. (B) Deletion frequencies of DLG2 in human and canine OS tumors. (C) Copy number profile of human and canine OS cell lines that are selected based on their DLG2 genomic status. Cell lines used in experiments exhibit DLG2 deletion. (D) Western blot analysis of selected cell lines with endogenous (Ctrl) or DLG2 overexpression.

Supplemental Figure 2. (A) DLG2 restoration does not induce proliferation changes under 2D culture conditions. Top panel shows cell lines cultured with 10% FBS, bottom panel with 1% FBS.

Supplemental Table 1**Clinical features of the breeds of dogs employed in this study**

Sample Number	Breed	Age	Sex	Survival Time
1	Rottweiler	7 yrs	MC	~6-7 months
2	Mixed Breed (German Shepherd/Collie/X)	8 yrs	MC	~12 months
3	Boxer	12 yrs	FS	~2-4 months
4	Mixed Breed (Labrador Retriever/X)	10 yrs	FS	~4-5 months
5	Rottweiler X (Canine Mixed Breed)	9 yrs	FS	~7 months
6	Greyhound	6 yrs	MC	~11 months
7	Bull Mastiff	8 yrs	MC	~6 months
8	Great Pyrenees	7 yrs	FS	~13 months
9	Great Pyrenees	5 yrs	MC	~5 months

Supplemental Table 2

DLG2 point mutations in various cancer genomes. Most mutations resulted in amino acid property changes.

a. *DLG2* mutations frequency in cancer

Tumor Type	# of Samples Analyzed	# of Mutation observed
Ovary	3	3
Pancreas	24	2
Breast	11	0
Pancreas	22	0
Skin	2	2
Biliary tract	2	0
Upper AG tract	3	3
Colon	11	0
CNS	22	0
Total	101	11

b. *DLG2* nonsynonymous mutations in cancer

mRNA	Protein	Before	After
c.2075G>A	p.R692Q	Positive	Polar
c.2158G>A	p.E720K	Negative	Positive
c.962C>T	p.P321L	Special	Hydrophobic
c.2287A>G	p.R763G	Positive	Polar
c.481G>T	p.V161F	Hydrophobic	Aromatic
c.491G>T	p.S164I	Polar	Hydrophobic
c.1589_1590CC>TT	p.S530F	Polar	Aromatic

Supplemental Table 3

167 differentially expressed probes/genes between DLG2 deleted and wild type canine primary tumors
