

## **Supplementary information**

miR828 and miR858 regulate VvMYB114 to promote anthocyanin and flavonol accumulation in grapes

**Varsha Tirumalai, Chenna Swetha, Ashwin Nair, Awadhesh Pandit, and P. V. Shivaprasad\***

### **Supplementary Figures**

Supplementary Fig. S1. Estimation of total anthocyanins and flavonols in fruit peels of grape lines used in this study.

Supplementary Fig. S2. DMACA staining of berries at various developmental stages.

Supplementary Fig. S3. TBO staining of berries at various developmental stages.

Supplementary Fig. S4. Small RNA profiling across selected grape lines.

Supplementary Fig. S5. Differential expression of known MicroRNAs across grape lines.

Supplementary Fig. S6. Sequence variations of miR828 and miR858 among plants

Supplementary Fig. S7. Phylogenetic tree of MYBs from grapes and targeting abilities of miR828 and miR858.

Supplementary Fig. S8. Schematic diagram of miRNA-mediated cleavage in MYB mRNAs through degradome analysis.

Supplementary Fig. S9. MYB RNAs accumulate differentially between grape lines.

Supplementary Fig. S10. MYB proteins accumulate differentially between grape tissues and lines.

Supplementary Fig. S11. Linear diagrams of the constructs used in this study.

Supplementary Fig. S12. Analysis of secondary silencing cascade in WER locus.

Supplementary Fig. S13. Phylogenetic tree of MYB activators and repressors from various plant species.

Supplementary Fig. S14. Quantification of anthocyanin content and RT-PCR from samples transiently expressing MYB genes and miRNAs.

Supplementary Fig. S15. Phenotypes of MYB expressing transgenic plants.

### **Supplementary Tables**

Supplementary Table S1. Summary of small RNA statistics.

Supplementary Table S2. Abundance and targets of conserved miRNAs from grape lines.

Supplementary Table S3. List of oligonucleotides used as probes.

Supplementary Table S4. Details of primer pairs used for cloning and qRT-PCR.

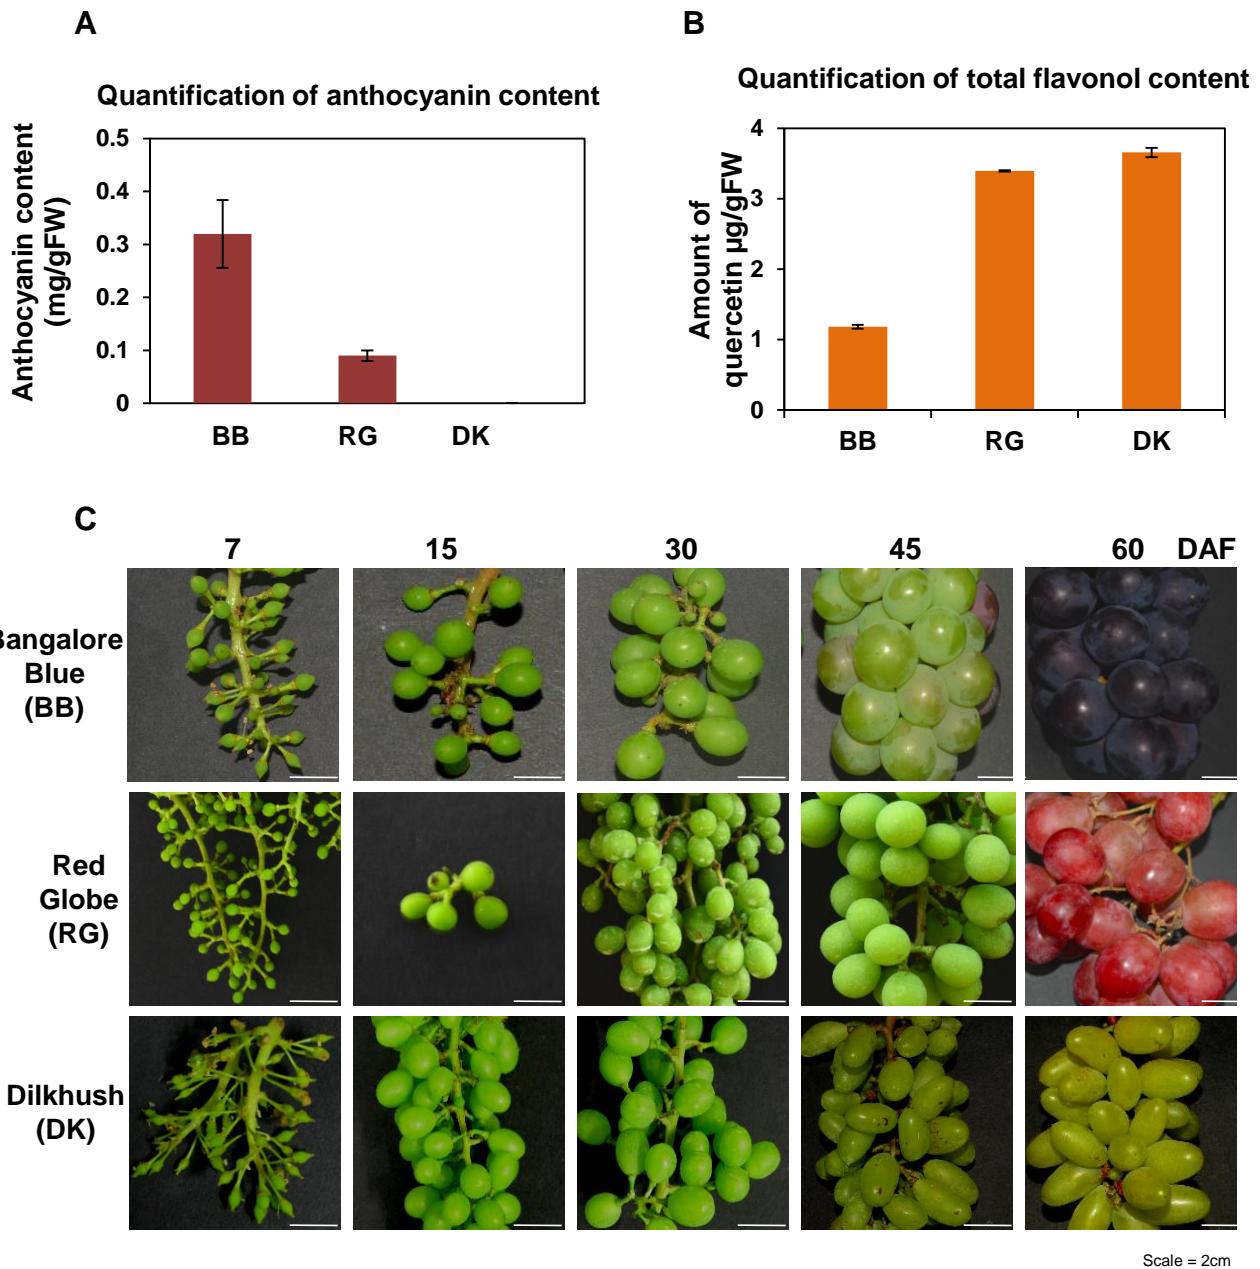

Supplementary Table S5. Mass spectrometric analysis of total proteins from reproductive tissues of the DK and BB grape lines.

Supplementary Table S6. Mass spectrometric analysis of total proteins from reproductive tissues of the DK and RG grape lines.

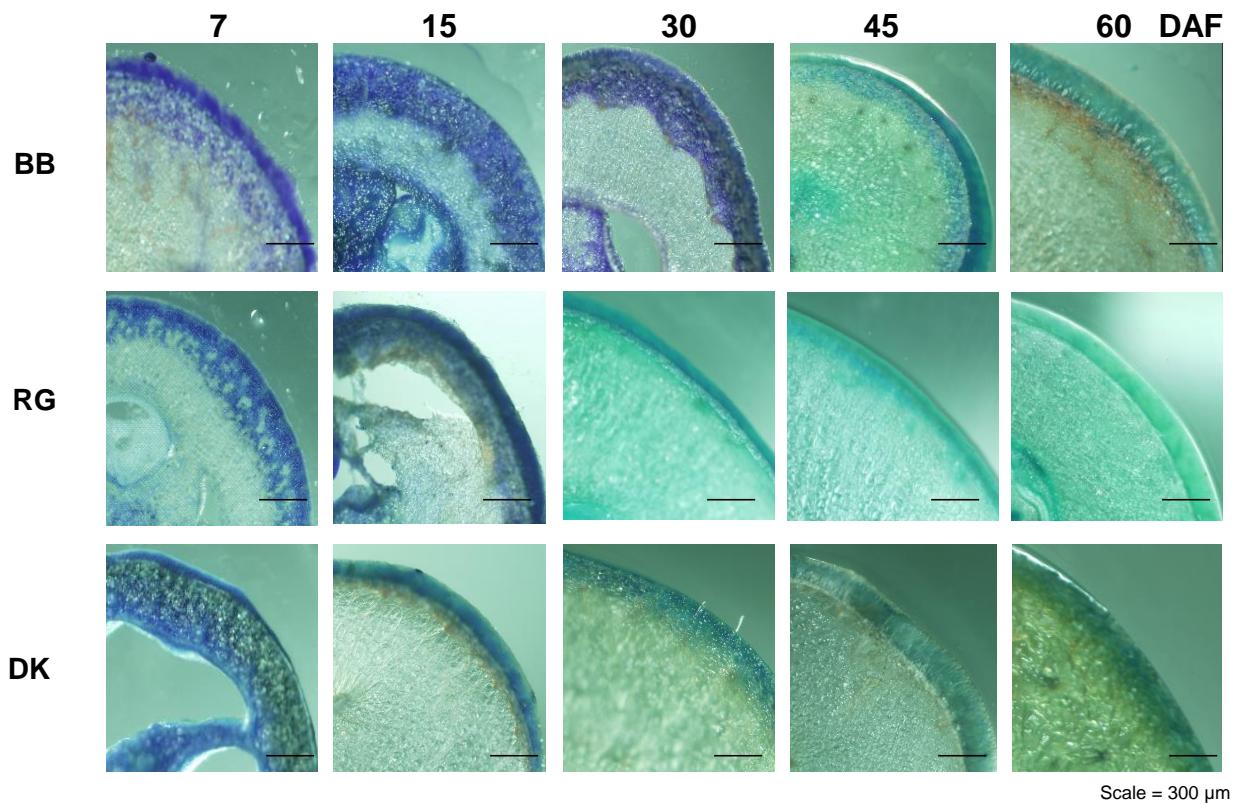

### **Supplementary datasets**

Supplementary Data Set S1. Differently expressed genes among the fruit peel samples.

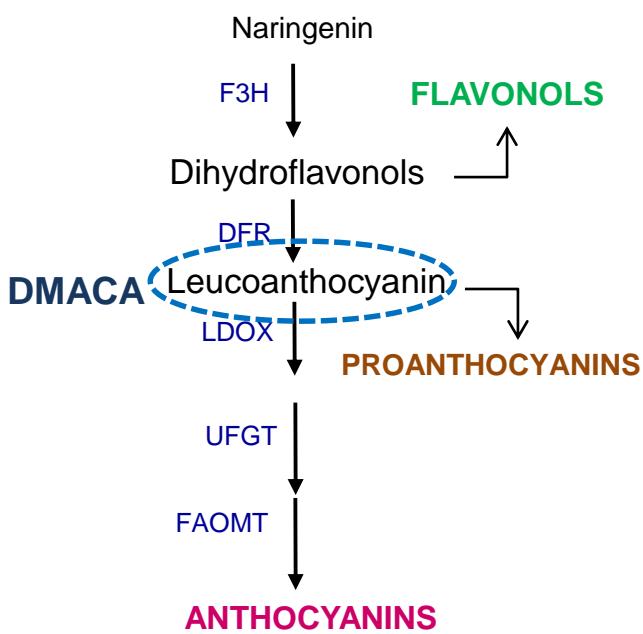

Supplementary Data Set S2. Differently expressed genes among grape young leaf samples.

Supplementary Fig. S1. Estimation of total anthocyanins and flavonols in fruit peels of the grape lines used in this study. (A) Estimation of total anthocyanin from the fruits peels of three varieties of grapes. Berries at 60 DAF (days after fertilization) were used for the estimation. The total anthocyanin was estimated as amount of malvidin. Data is represented as mean  $\pm$  SE of three replicates. (B) Estimation of total flavonols from the fruits peels. Berries at 60 DAF were used for the estimation. The total flavonol content is estimated as amount of quercetin in the sample. Data is represented as mean  $\pm$  SE of three replicates. (C) Grape berries at various developmental stages for the lines used in this study. Only at 60 DAF the accumulation of anthocyanin is seen in BB and RG lines. Scale - 2cm.

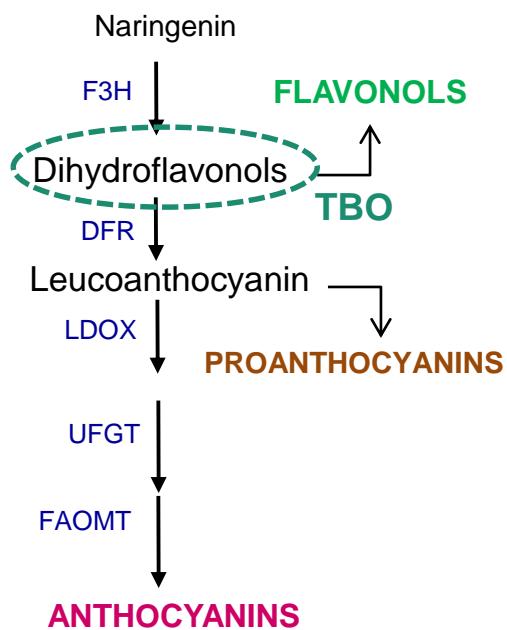

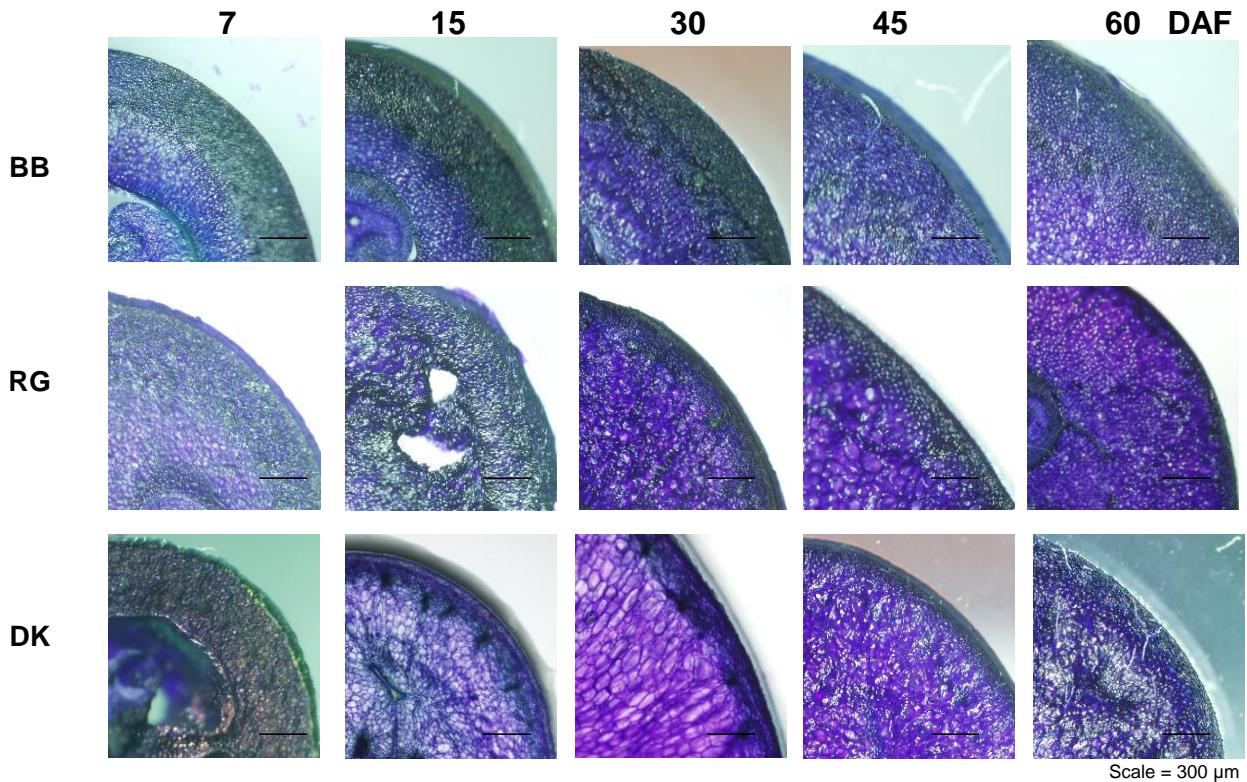

Scale = 300  $\mu\text{m}$

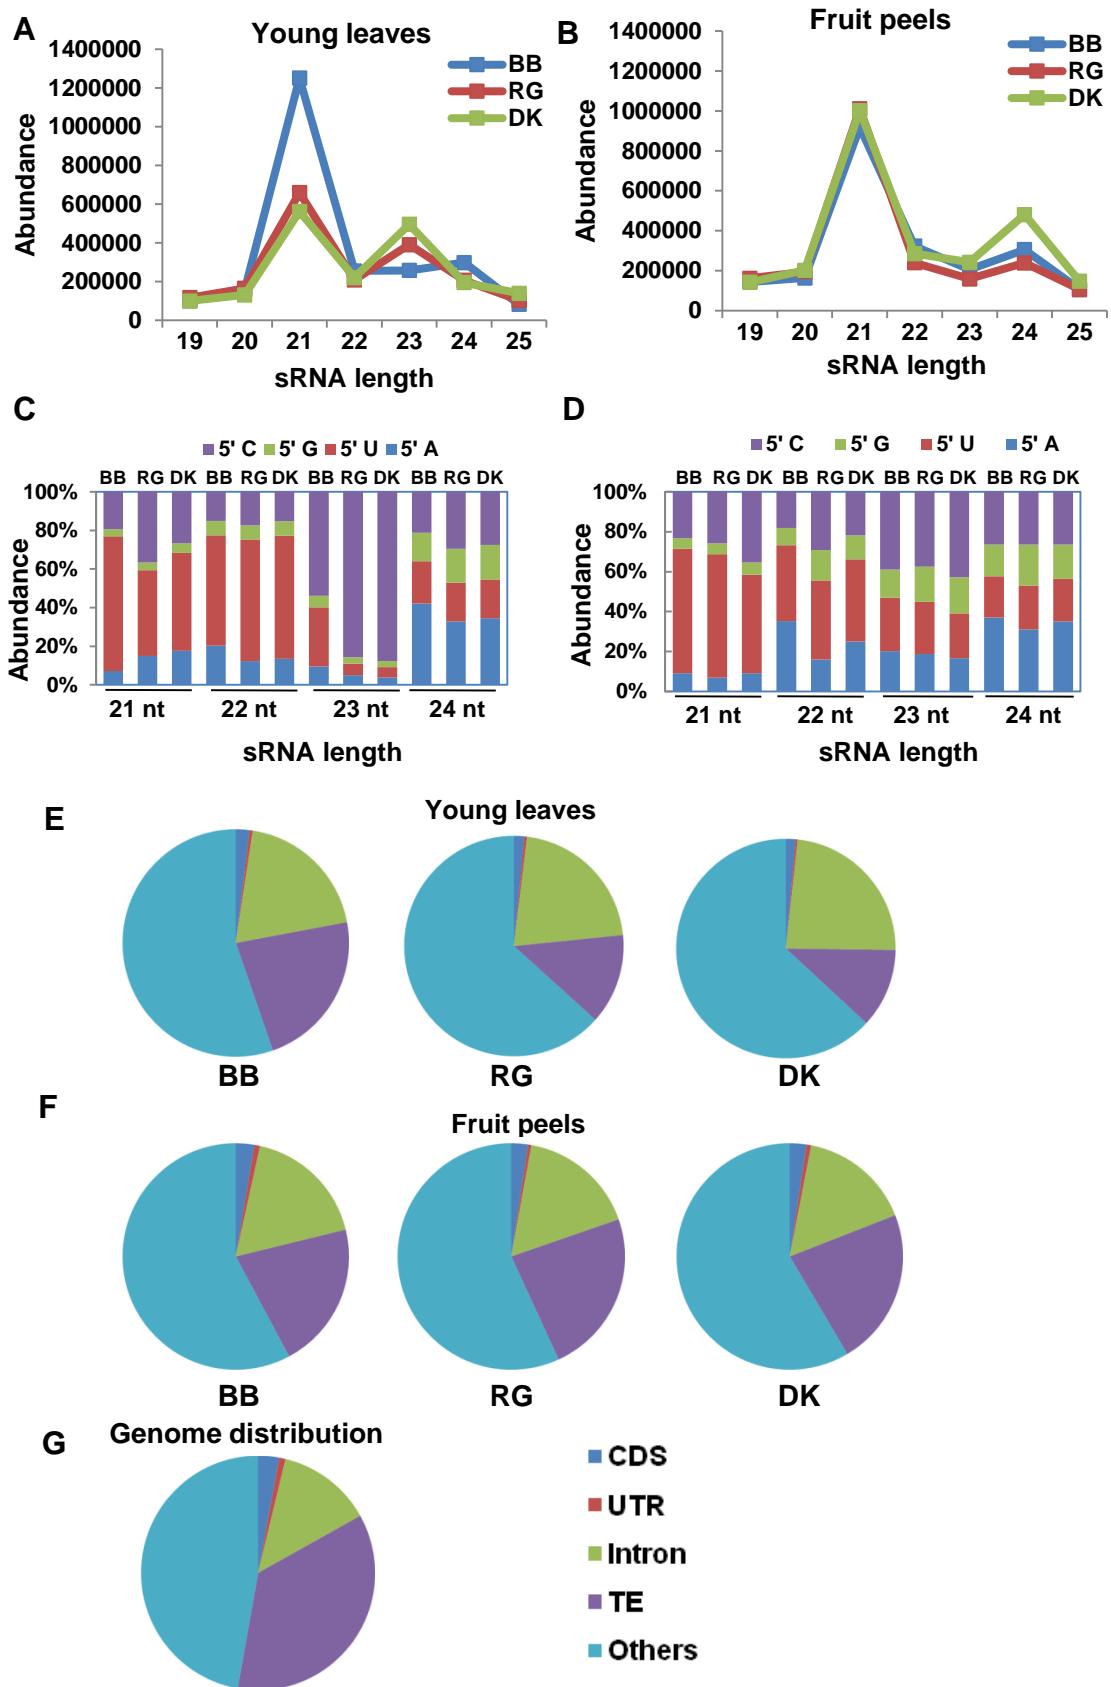

Supplementary Fig. S2. DMACA staining of berries at various developmental stages. Sections of berries at various DAF were stained for the detection of proanthocyanidins (PA) and their precursor molecules using DMACA. Purple/blue color represents presence of PA compounds. Scale - 300μm.

The schematic highlights the precursor molecule to which DMACA binds in the phenylpropanoid pathway.

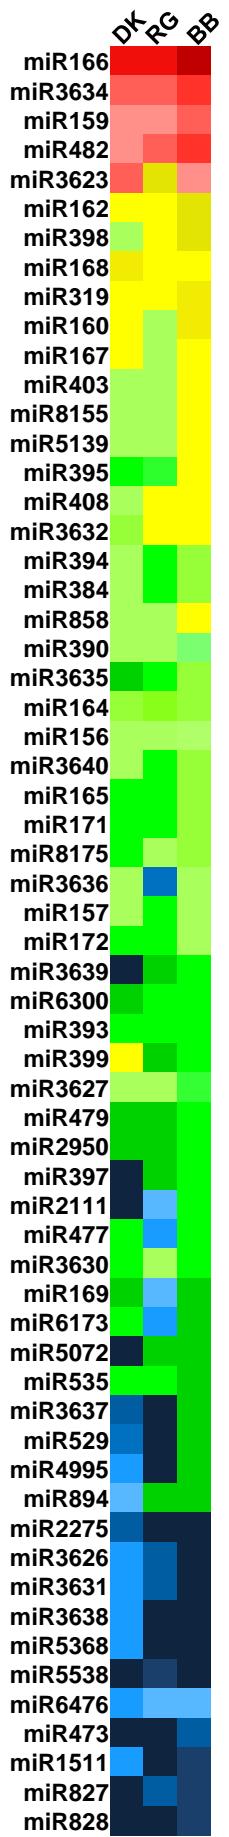

Supplementary Fig. S3. TBO staining of berries at various developmental stages. Sections of berries at different stages after fertilization were stained for the detection of Dihydroflavonols using TBO. Greenish-blue color represents the presence of precursor molecules of anthocyanins. Scale - 300 $\mu$ m. The schematic in the bottom panel shows to which precursor molecule TBO binds.

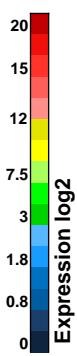

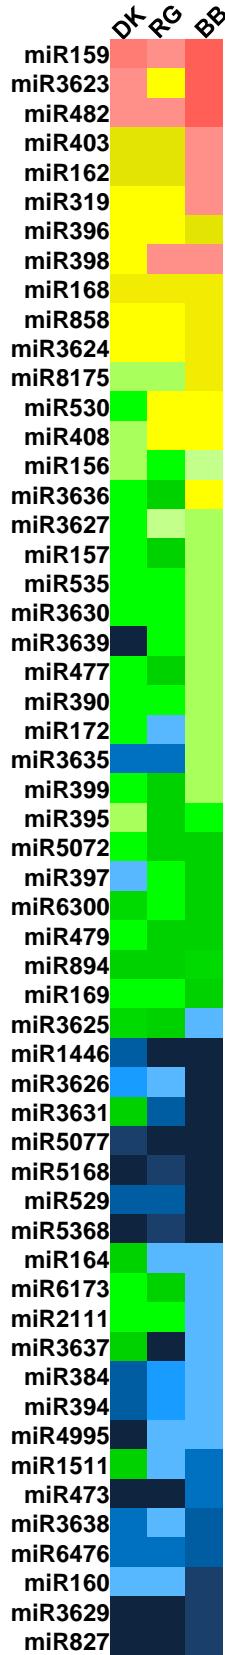

Supplementary Fig. S4. Small RNA profiling across selected grape lines. Small RNA profile of young leaf (A) and fruit peel (B) tissues of three grape lines. Values are average of two biological replicates. Nucleotide preferences of the small RNAs at 5' position in young leaves (C) and fruit peels (D). Distribution of siRNAs found in small RNA datasets of three grape lines in young leaves (E) and fruit peels (F). Pie charts shows the percentage of reads mapping to CDS (coding regions), UTR (untranslated regions), introns, TE (transposable elements) and other repeats in the annotated *Vitis vinifera* genome. In (G), genomic representation indicating percentage of genomic regions in the grape genome to highlight unusually high percentage of intronic and transposon regions.

### Young leaves

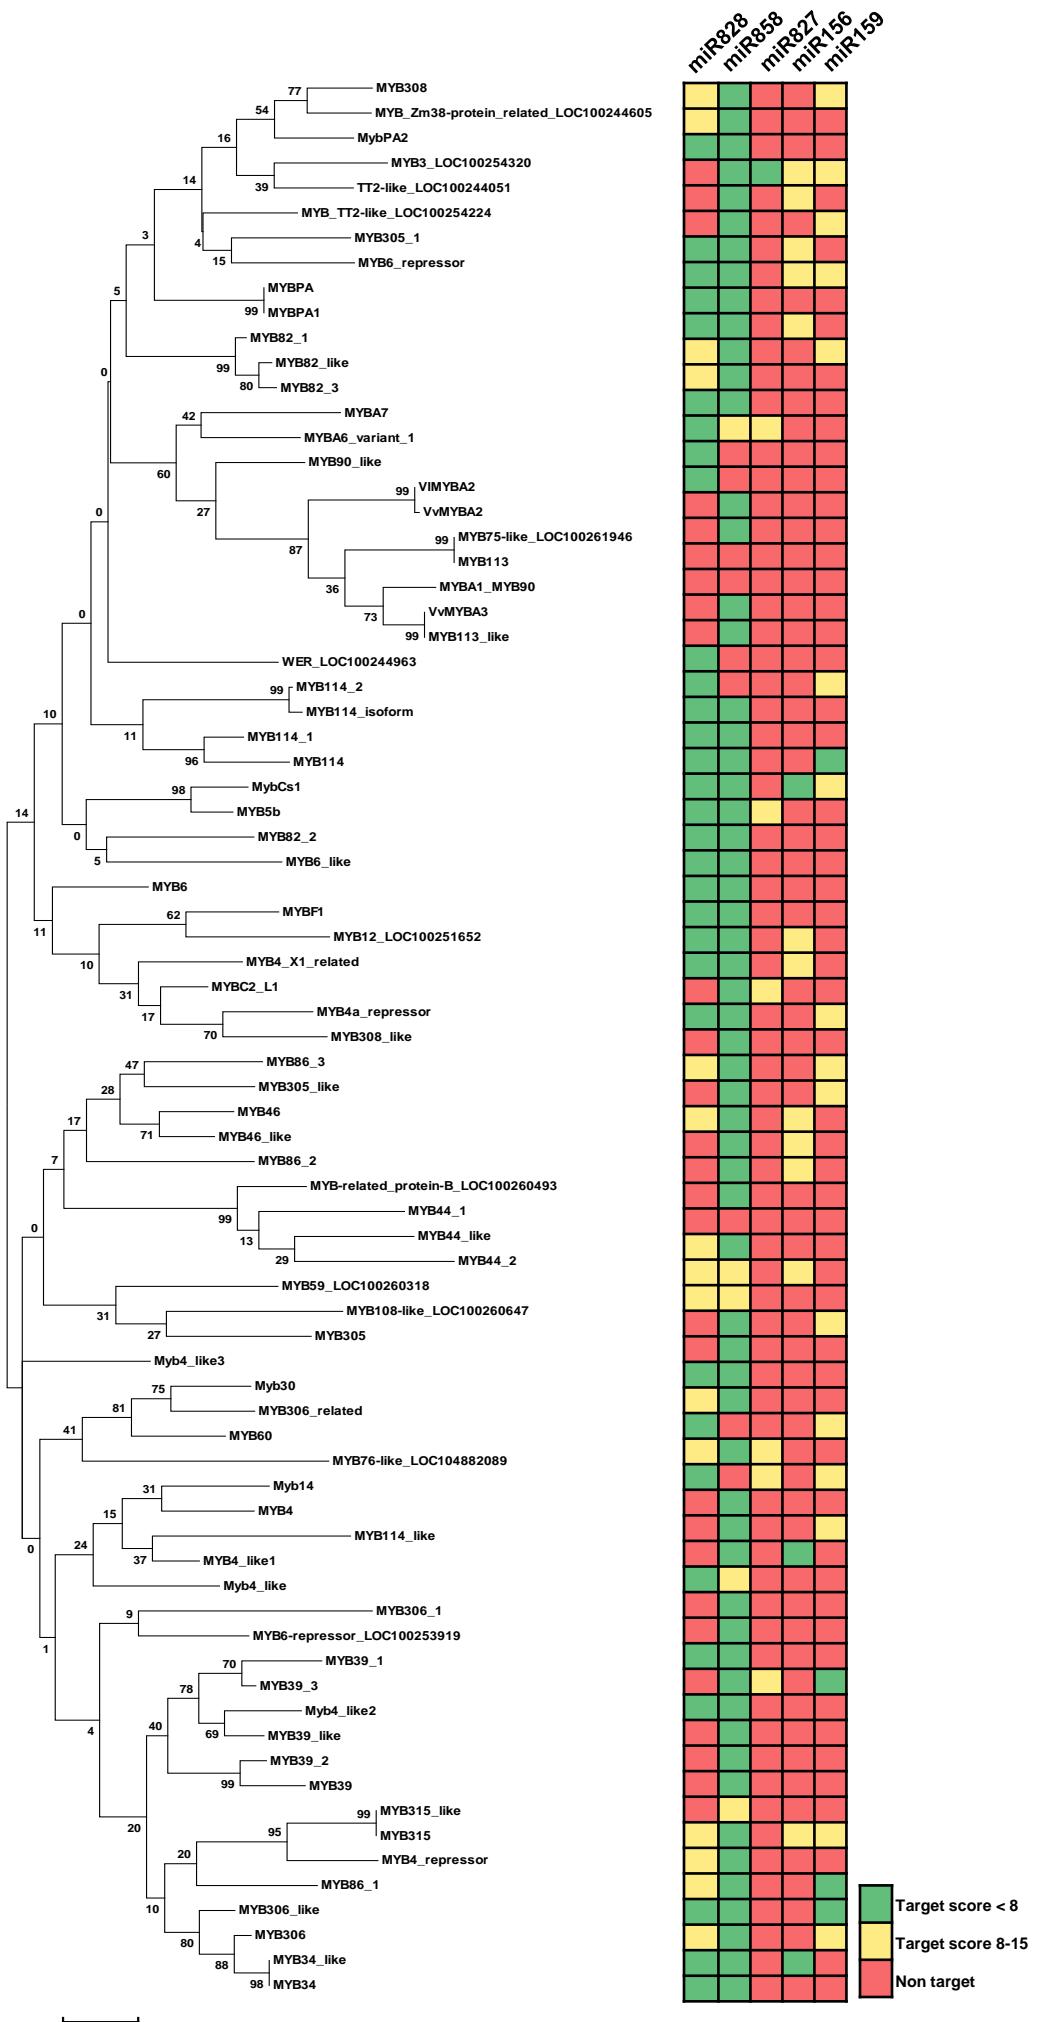

### Fruit peels

Supplementary Fig. S5. Differential expression of known MicroRNAs across grape lines.

Heat maps of conserved and non-conserved miRNAs(miRBase ver. 21) across the young leaves and fruit peel tissues of grape lines. A cut-off of  $\log_2(\text{fold change}) > 2$  was used for differential expression analysis of miRNA.

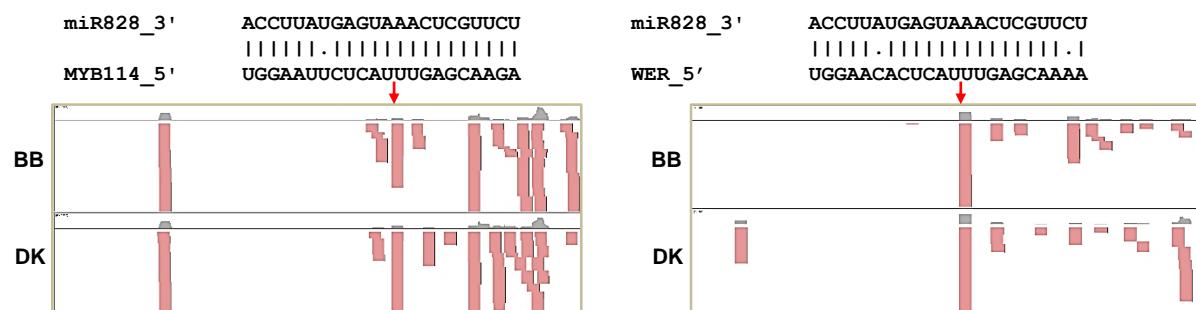

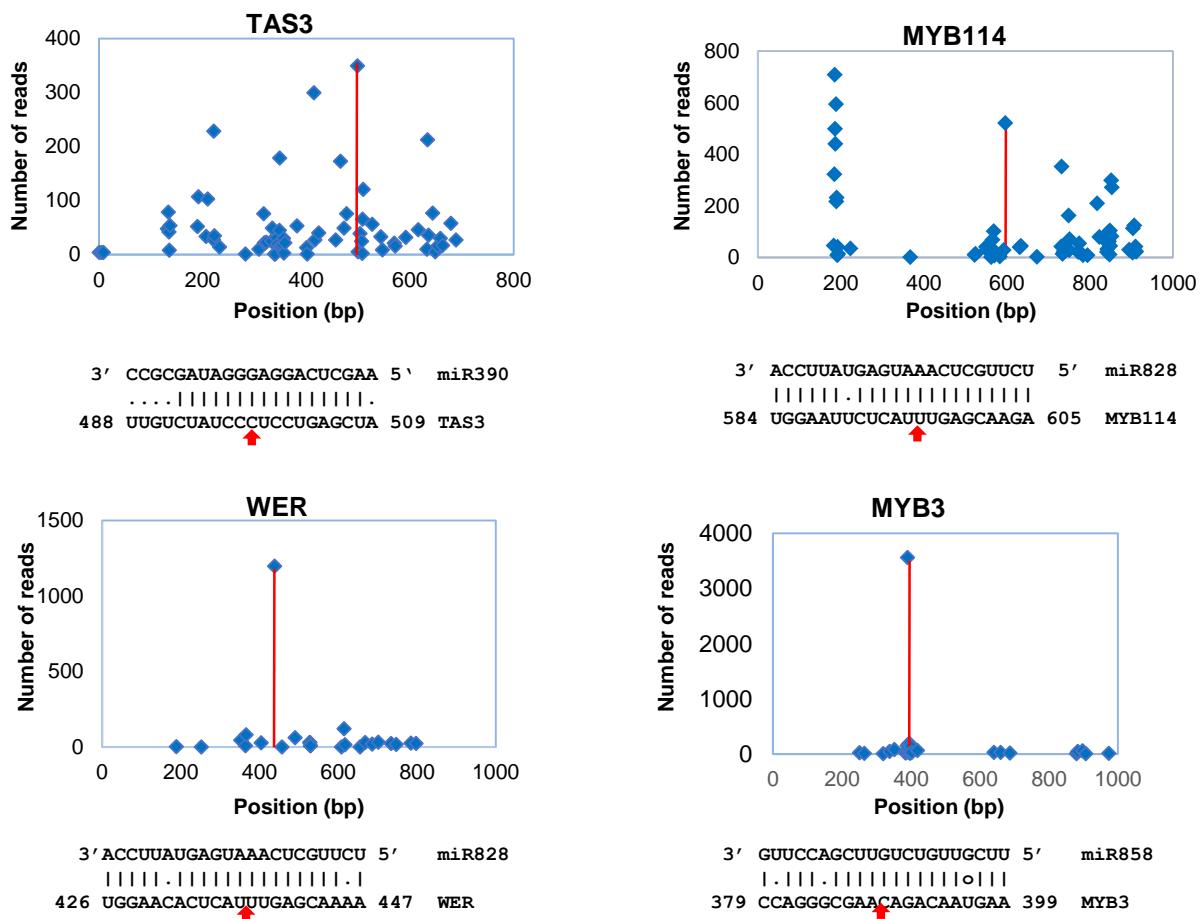

Supplementary Fig. S6. Phylogenetic tree of MYBs from grapes and targeting abilities of miR828, miR858, miR827, miR156 and miR159.

The sequences of mRNA belonging to R2R3 MYB family were obtained from NCBI. The phylogenetic tree was constructed using maximum likelihood method using bootstrap 100. The figure also shows the miRNAs that target different MYB mRNAs, predicted using TAPIR analysis. Colored boxes indicate extent of MYB targeting, generated using TAPIR.

Supplementary Fig. S7. Sequence variations among selected miRNAs.

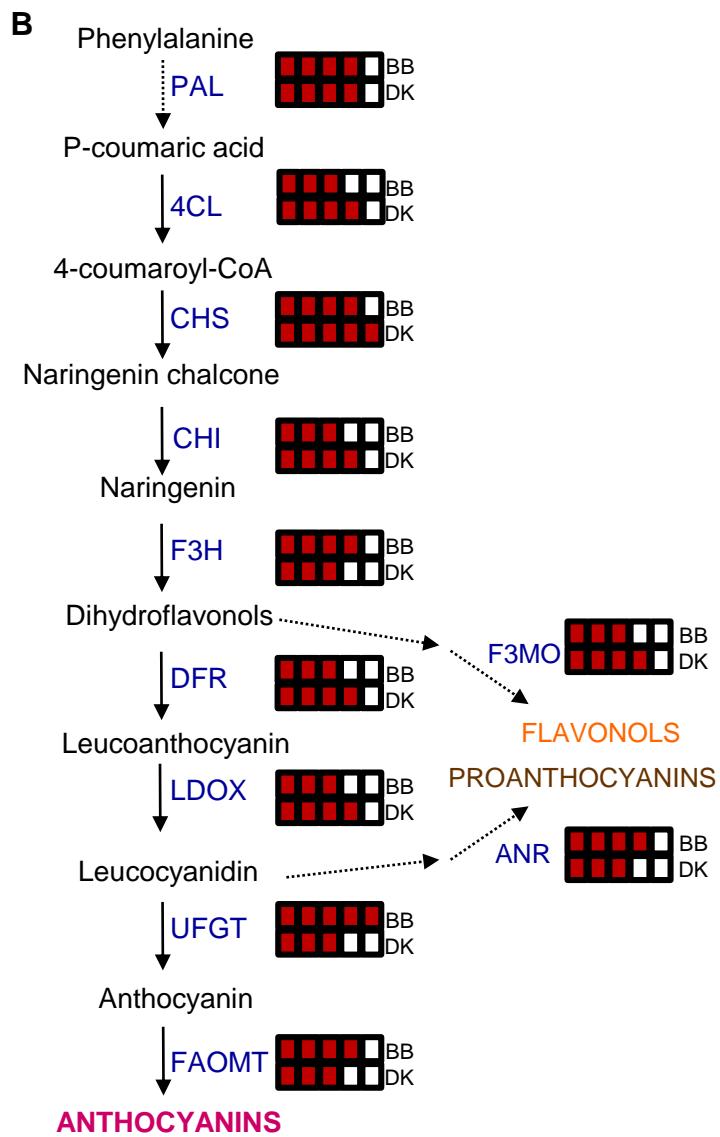

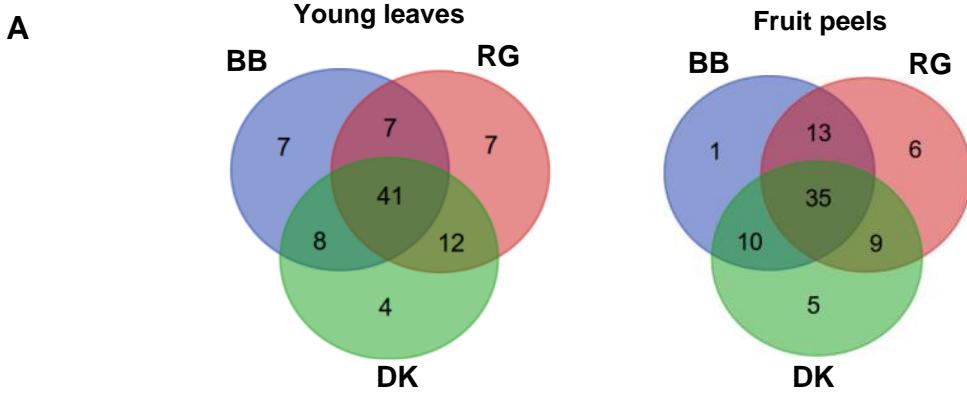

The sequences of MYB targeting microRNAs such as miR858 (A), miR828 (B) obtained from miRBase. The mismatch is represented in black.

**A****B**

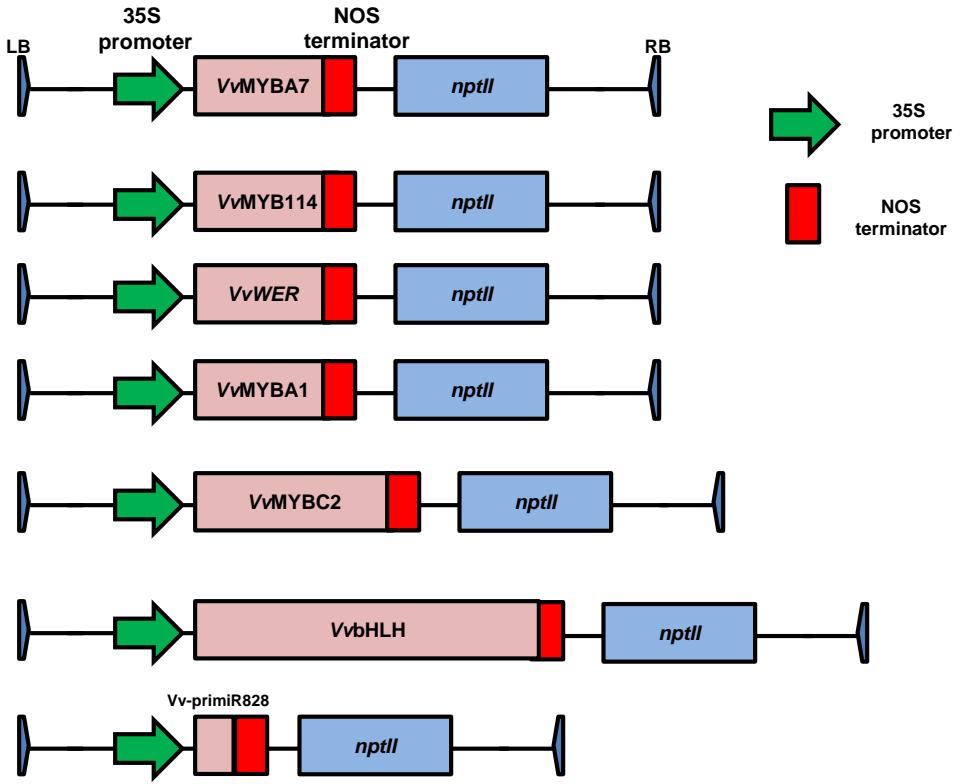

Supplementary Fig. S8. (A) Schematic diagram of miR828 mediated cleavage in MYB114 and WER in BB and DK. The degradome datasets were obtained from GSE118701 the reads were aligned to the MYB sequences using in-house pipelines and results were represented as T-plots (B). The sequence pairing of the miRNA – mRNA is shown below with cleavage site marked. TAS3 served as a control.

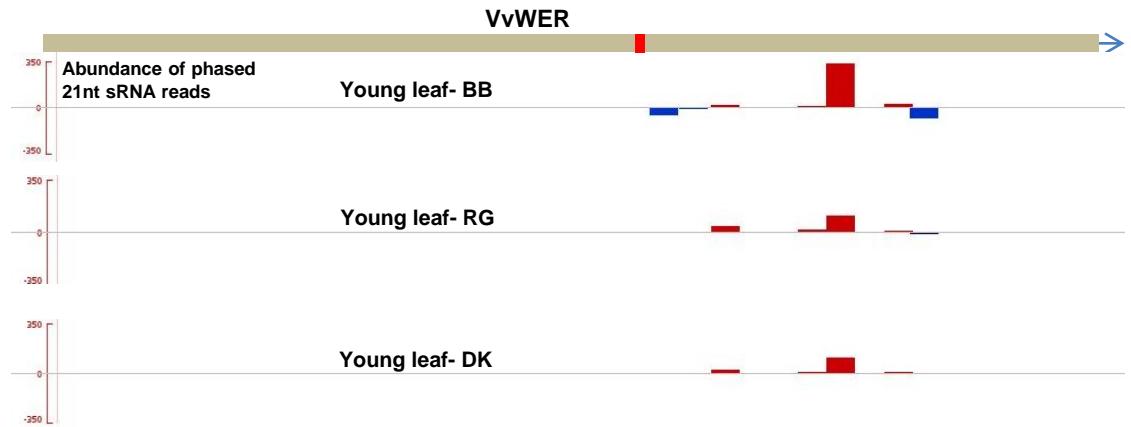

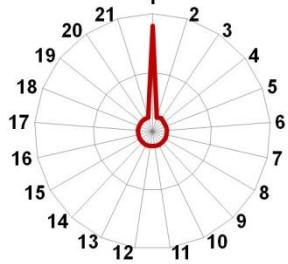

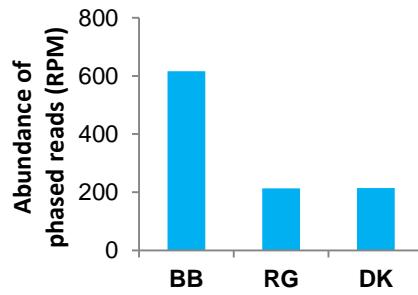

Supplementary Fig. S9. (A) Venn diagram representing total number of genes identified among grape lines. (B) RT-PCR confirmation of differential expression for specific phenylpropanoid pathway mRNAs.

Supplementary Fig. S10. MYB proteins accumulate differentially between grape tissues and lines.  
 (A) Venn diagram summarizing differentially expressed proteins identified by LC-MS/MS analysis.  
 (B) Schematic representation of comparative expression of phenylpropanoid pathway proteins in fruit peels of BB and DK lines. Values represented as filled boxes out of 5.

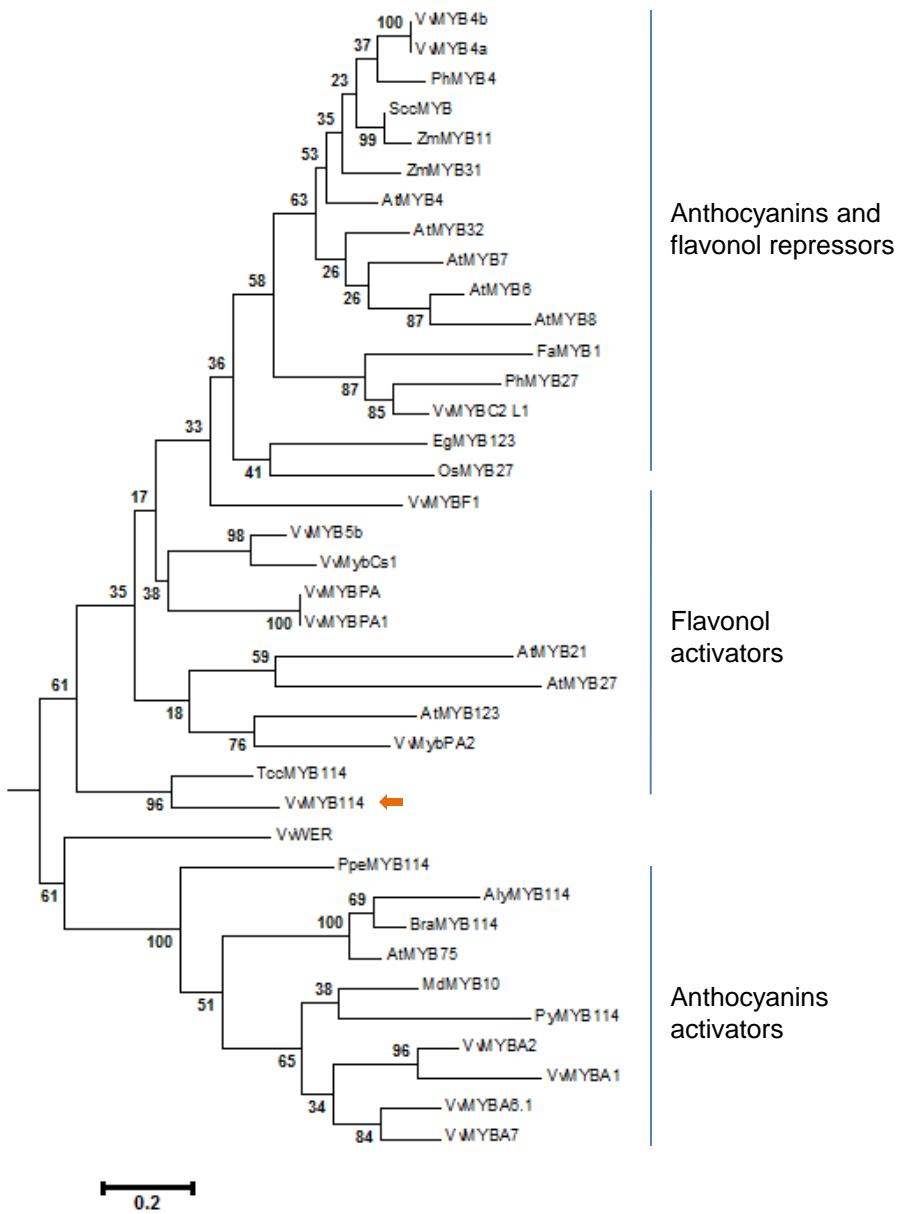

Supplementary Fig. S11. Linear diagrams of the constructs used in this study.

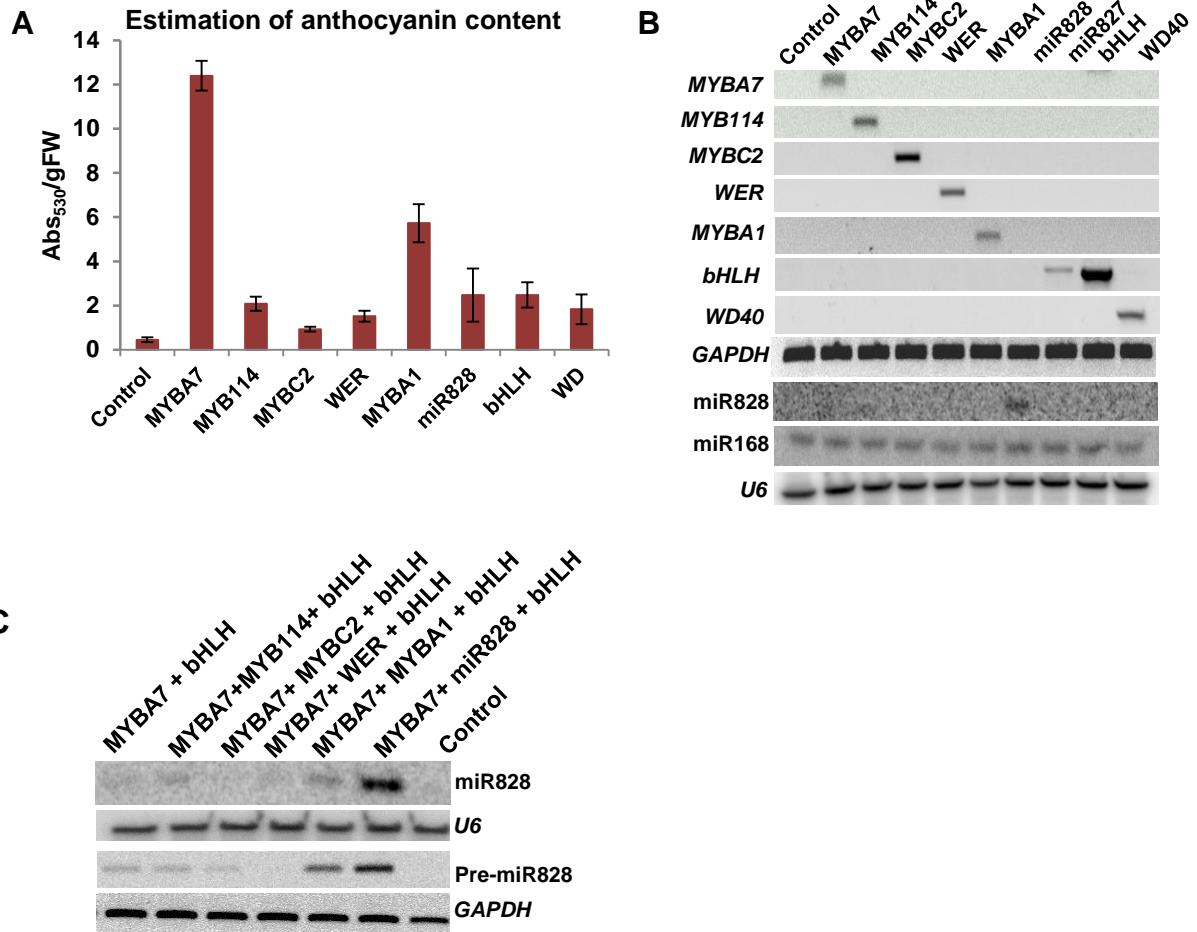

**A****B****C**

Supplementary Fig. S12. Analysis of secondary silencing cascade in WER locus.

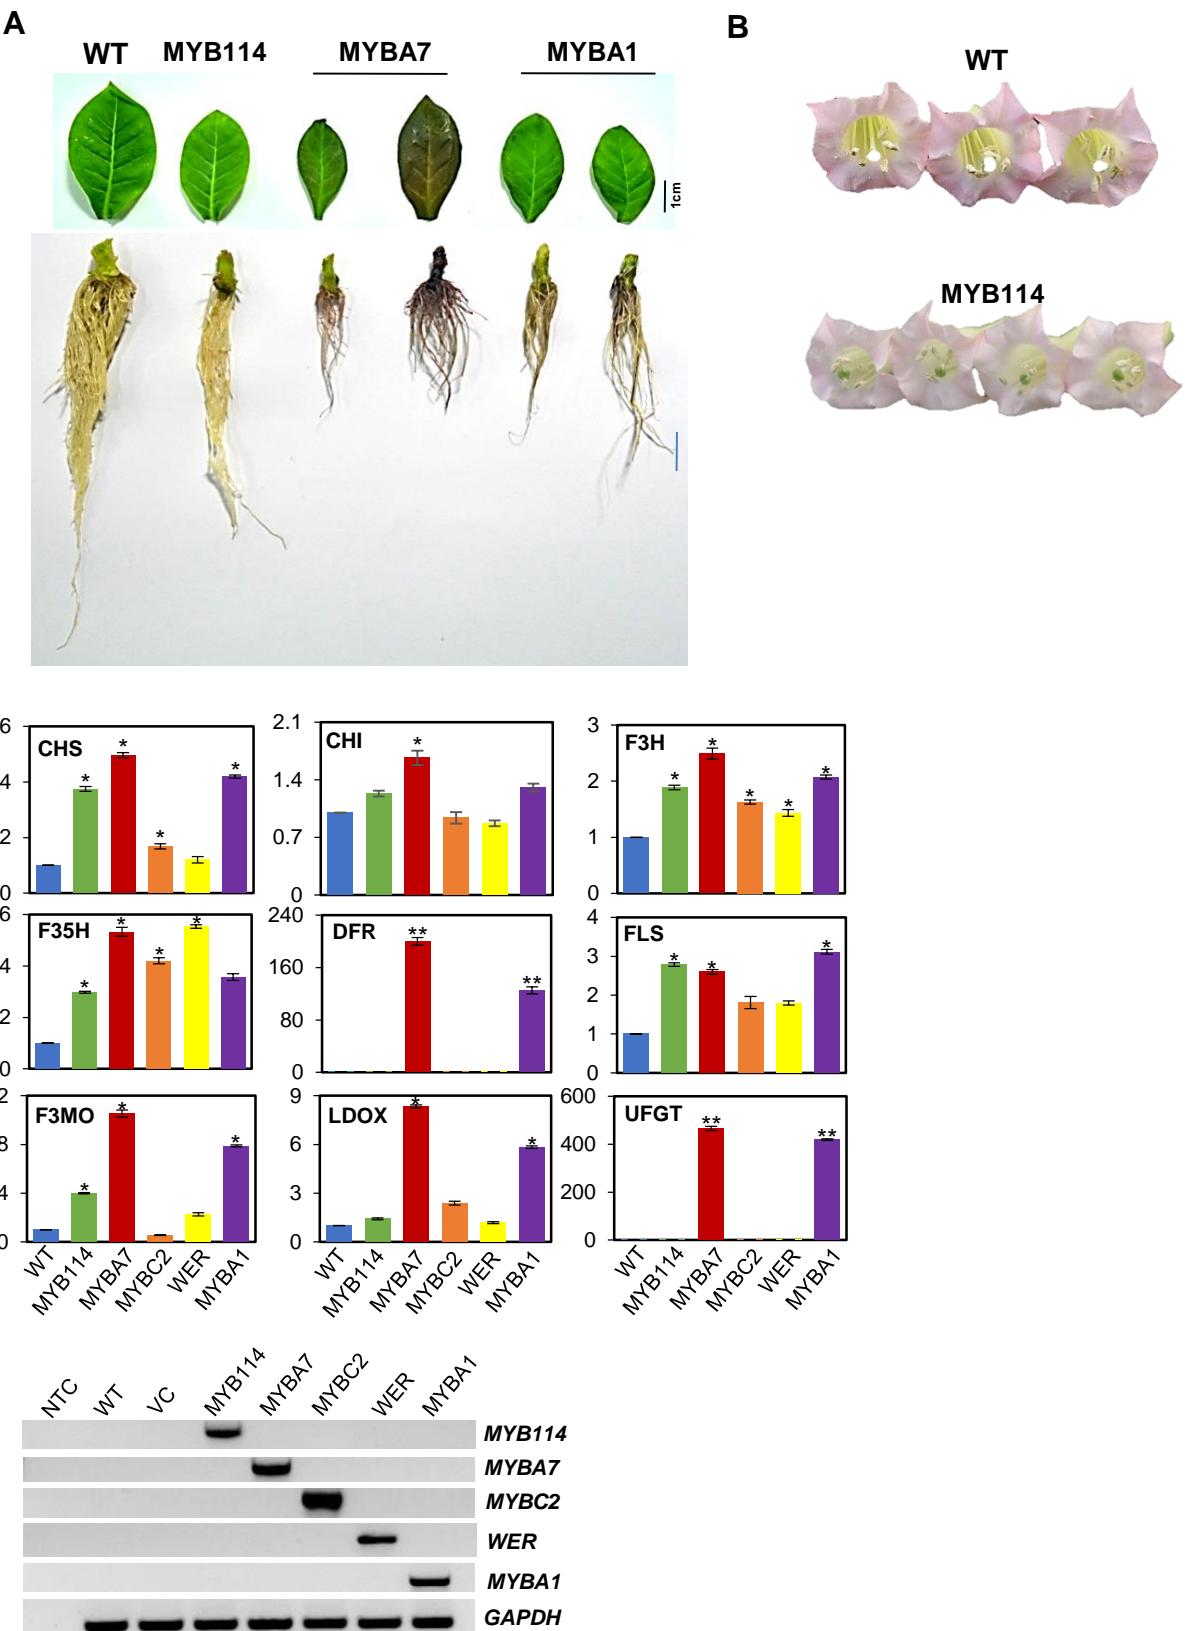

(A) A schematic representation of phased sRNA matching WER locus in different grape lines. miR828 target site is shown as red box. (B) Phasing register for WER locus. (C) Abundance of phased siRNAs in grape lines.

Supplementary Fig. S13. Phylogenetic tree of MYB activators and repressors from various plant species. The sequences R2R3 MYB family members were obtained from NCBI. The phylogenetic tree was constructed using maximum likelihood method using bootstrap 100. *Vitis* MYB114 falls into a unique clade.

Supplementary Fig. S14. Estimation of anthocyanin and RT-PCR from samples transiently expressing MYB genes and miRNAs. Panel (A) shows anthocyanin content in infiltrated tissues. Data is represented as mean  $\pm$  SE of three replicates. (B) Confirmation of expression of infiltrated MYBs and miRNAs. GAPDH and U6 served as controls for mRNAs and sRNAs, respectively. (C) MYBs can induce the transcription of MIR828 gene in grapes. The figures shows the northern hybridization for miR828 and an RT-PCR for pre-miRNA in MYB infiltrated samples. U6 and GAPDH serve as controls.

Supplementary Fig. S15. Phenotype of MYB expressing transgenic plants (A) (B). Phenotype of MYB114 OE flowers showing reduced anthocyanin accumulation. (C) Quantitative expression analysis for flavonol and anthocyanin biogenesis genes in selected transgenic plants using qRT-PCR from leaf samples. *GAPDH* served as control. Names of abbreviated genes are provided in Supplementary Table 4.(D) Expression of MYB in the stable transgenic lines used for qRT-PCR analysis. Wildtype (WT) and vector control (VC) plants serve as controls
