“Species-pump” Hypothesis Repeated climate-driven fragmentation of the Philippine Islands was a primary mechanism of speciation for terrestrial fauna

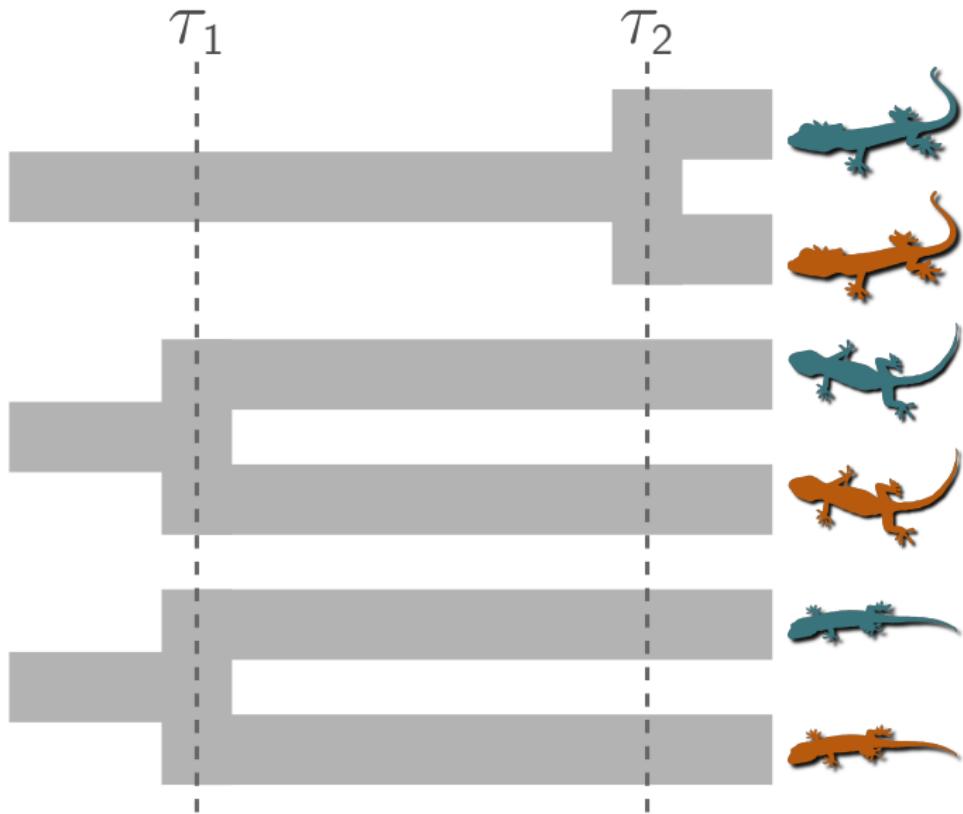

“Species-pump” Hypothesis Repeated climate-driven fragmentation of the Philippine Islands was a primary mechanism of speciation for terrestrial fauna

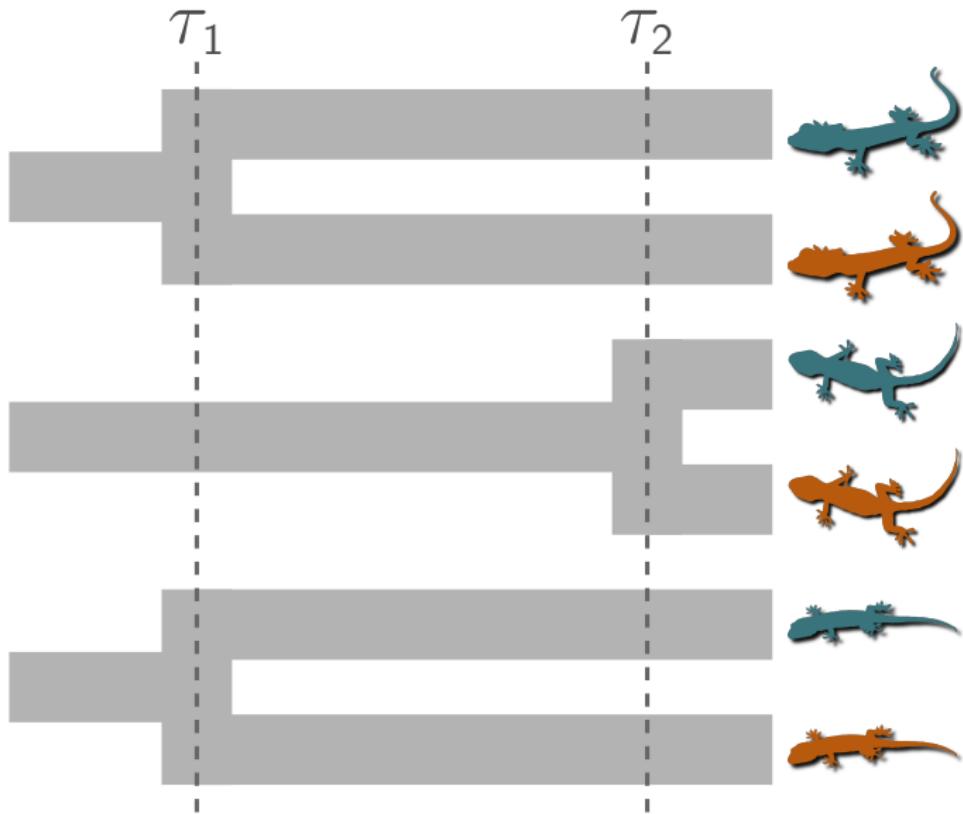

Prediction Taxa co-distributed across islands within the same Pleistocene aggregate island complex (PAIC) will have divergence times that tend to be clustered around times when sea levels fragmented the islands

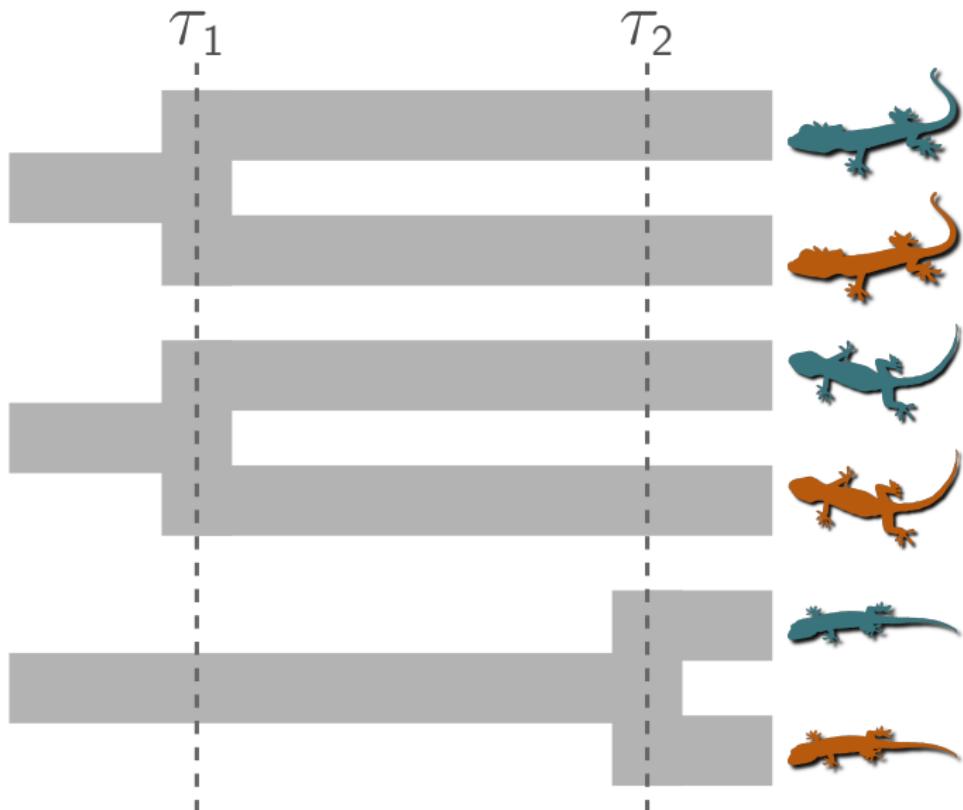

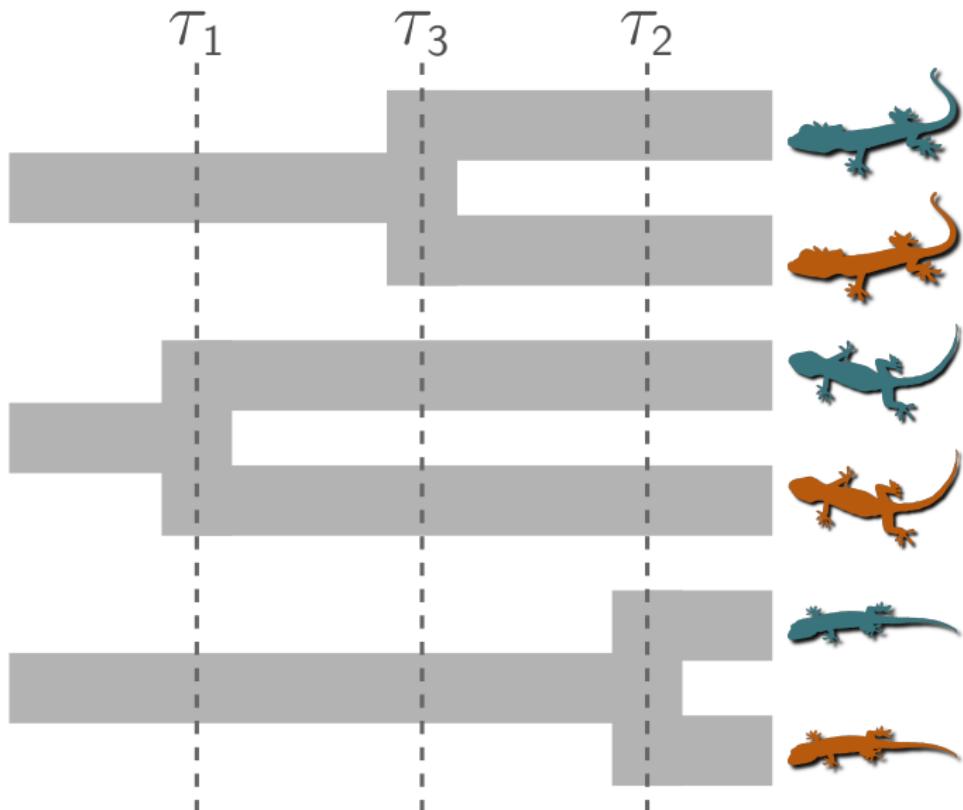

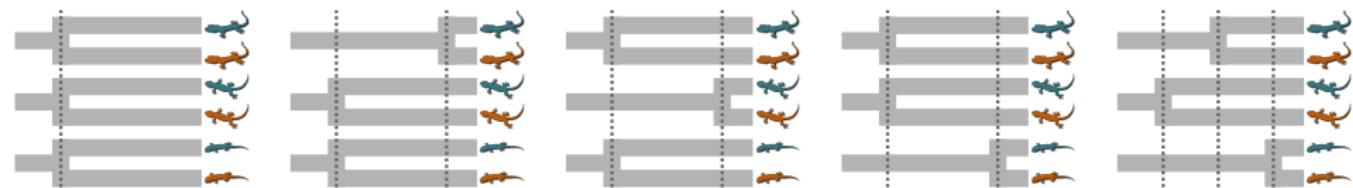

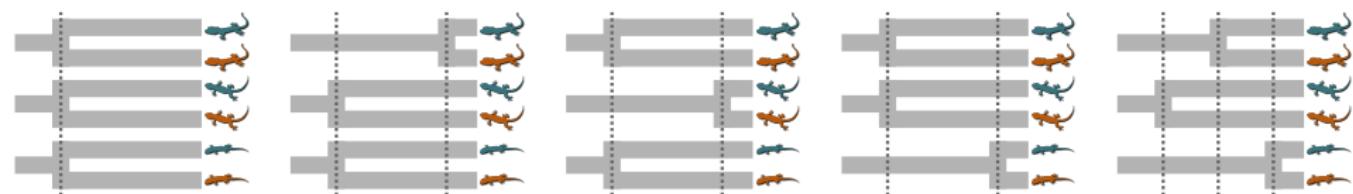

m_1 m_2 m_3 m_4 m_5 

We want to infer the model and divergence times given genetic data

Previous tests of “species-pump”

- ▶ Oaks et al. (2013)¹ collected mitochondrial DNA sequences from 22 pairs of populations (including bats, shrews, skinks, geckos, snakes, and frogs)

¹ J. R. Oaks et al. (2013). *Evolution* 67: 991–1010. ² W. Huang et al. (2011). *BMC Bioinformatics* 12: 1.

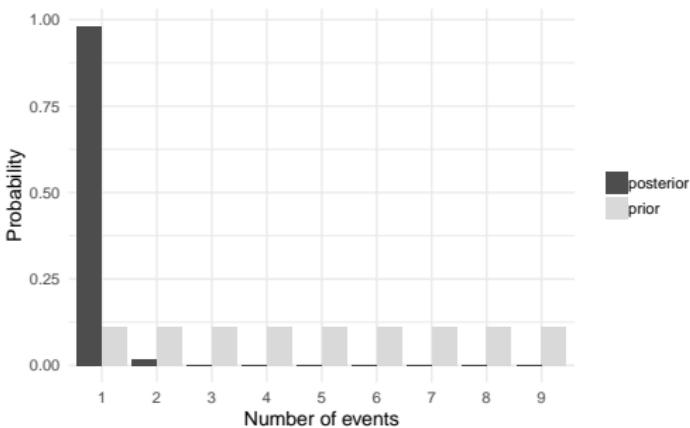

Previous tests of “species-pump”

- ▶ Oaks et al. (2013)¹ collected mitochondrial DNA sequences from 22 pairs of populations (including bats, shrews, skinks, geckos, snakes, and frogs)
 - ▶ Analyzed these data with ABC method `msBayes`²

¹ J. R. Oaks et al. (2013). *Evolution* 67: 991–1010. ² W. Huang et al. (2011). *BMC Bioinformatics* 12: 1.

Previous tests of “species-pump”

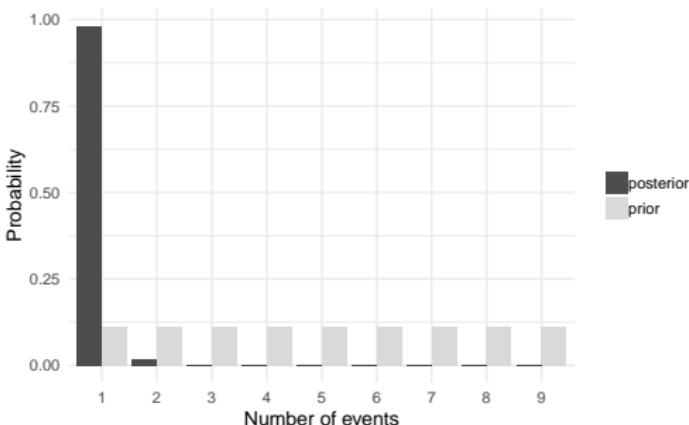

- ▶ Oaks et al. (2013)¹ collected mitochondrial DNA sequences from 22 pairs of populations (including bats, shrews, skinks, geckos, snakes, and frogs)
 - ▶ Analyzed these data with ABC method msBayes²
 - ▶ Found strong support for shared divergences across taxa (results below for 9 pairs from islands of Negros and Panay)

¹ J. R. Oaks et al. (2013). *Evolution* 67: 991–1010. ² W. Huang et al. (2011). *BMC Bioinformatics* 12: 1.

Previous tests of “species-pump”

- ▶ Oaks et al. (2013)¹ collected mitochondrial DNA sequences from 22 pairs of populations (including bats, shrews, skinks, geckos, snakes, and frogs)
 - ▶ Analyzed these data with ABC method msBayes²
 - ▶ Found strong support for shared divergences across taxa (results below for 9 pairs from islands of Negros and Panay)
 - ▶ But, method was very sensitive to prior assumptions and often biased toward estimating co-divergences

¹ J. R. Oaks et al. (2013). *Evolution* 67: 991–1010. ² W. Huang et al. (2011). *BMC Bioinformatics* 12: 1.

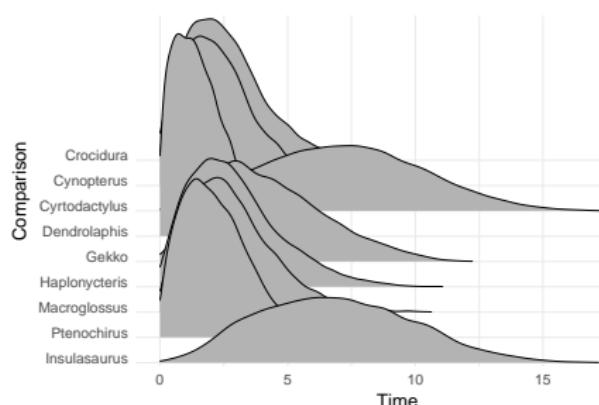

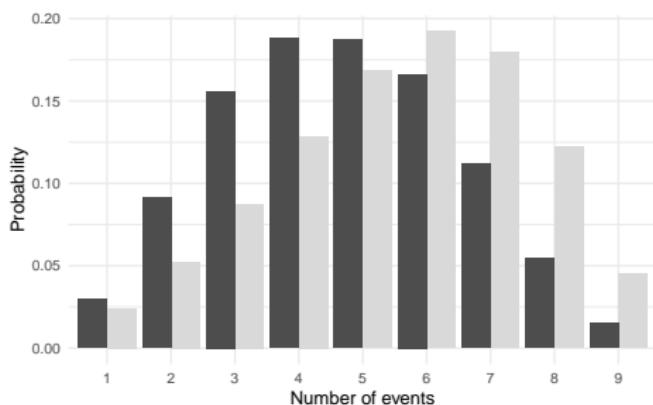

Previous tests of “species-pump”

- ▶ Oaks (2014)¹ reanalyzed the data from Oaks et al. (2013)² with a modified ABC method `dpp-msbayes`

¹ J. R. Oaks (2014). *BMC Evolutionary Biology* 14: 150. ² J. R. Oaks et al. (2013). *Evolution* 67: 991–1010.

Previous tests of “species-pump”

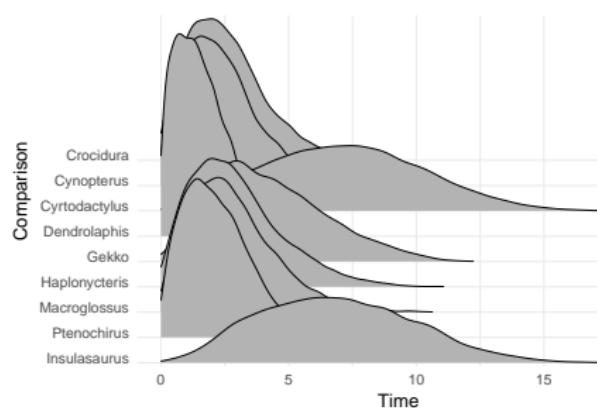

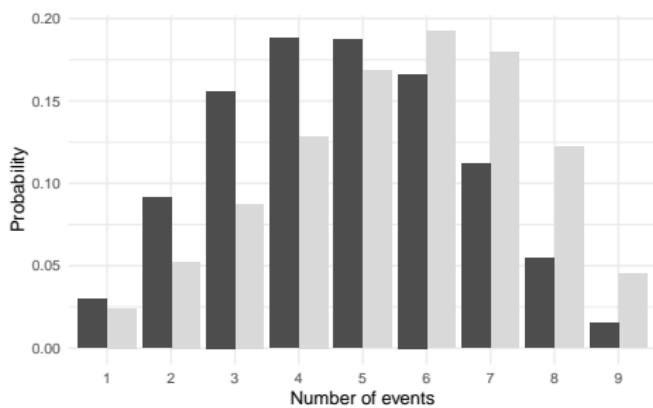

- ▶ Oaks (2014)¹ reanalyzed the data from Oaks et al. (2013)² with a modified ABC method dpp-msbayes
 - ▶ New method was less biased, but little information in summary statistics to inform divergence times

¹ J. R. Oaks (2014). *BMC Evolutionary Biology* 14: 150. ² J. R. Oaks et al. (2013). *Evolution* 67: 991–1010.

Previous tests of “species-pump”

- ▶ Oaks (2014)¹ reanalyzed the data from Oaks et al. (2013)² with a modified ABC method dpp-msbayes
 - ▶ New method was less biased, but little information in summary statistics to inform divergence times

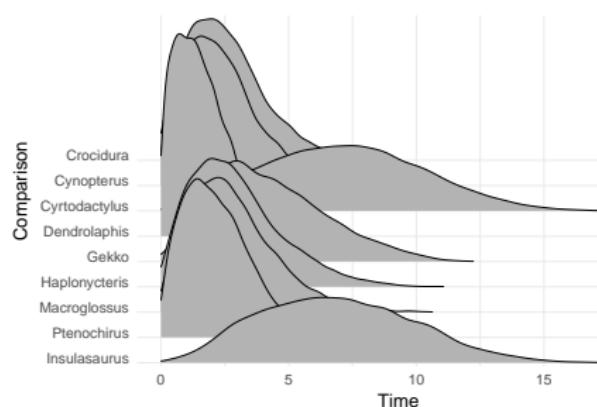

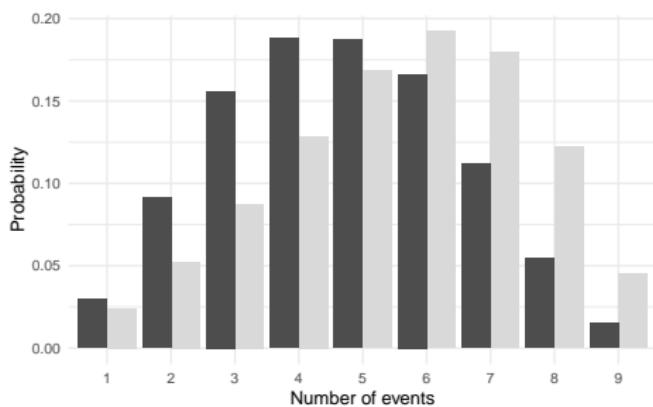

What now? We need **more data** and/or an **improved method** that better utilizes the information in those data.

¹ J. R. Oaks (2014). *BMC Evolutionary Biology* 14: 150. ² J. R. Oaks et al. (2013). *Evolution* 67: 991–1010.

Cyrtodactylus (Gekkonidae)

- ▶ 265+ species across Asia
- ▶ 10+ species across Philippines
- ▶ Nocturnal, scansorial lizards that eat terrestrial invertebrates
- ▶ Specialized bent toes for climbing

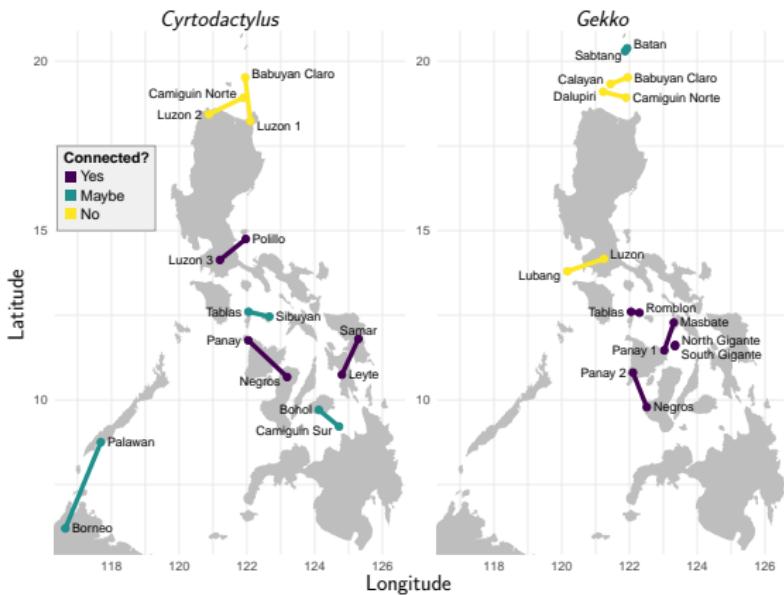

Gekko (Gekkonidae)

- ▶ 60+ species across Southeast Asia
- ▶ 14+ species across Philippines
- ▶ Nocturnal, scansorial lizards that eat terrestrial invertebrates
- ▶ Subdigital lamellae for climbing

Methods

- ▶ Sampled individuals from 8 pairs of populations for both *Cyrtodactylus* and *Gekko*
 - ▶ Sampled 2–5 individuals per population
- ▶ Collected genome-wide DNA sequence data from each individual
 - ▶ Restriction-site-associated DNA sequencing (RADseq)

Analyzed RADseq data with full-likelihood Bayesian comparative phylogeographic method:

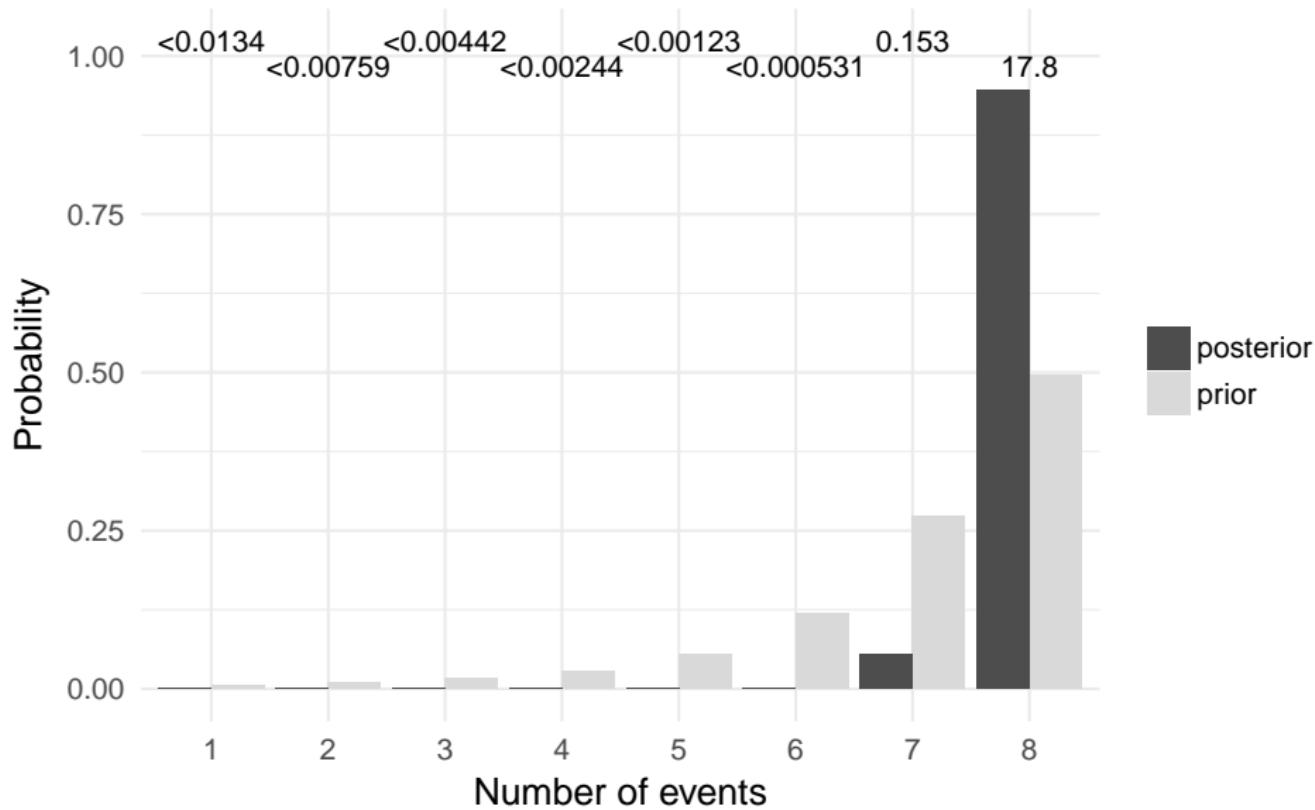

Ecoevolvity: Estimating evolutionary coevality

Analyzed RADseq data with full-likelihood Bayesian comparative phylogeographic method:

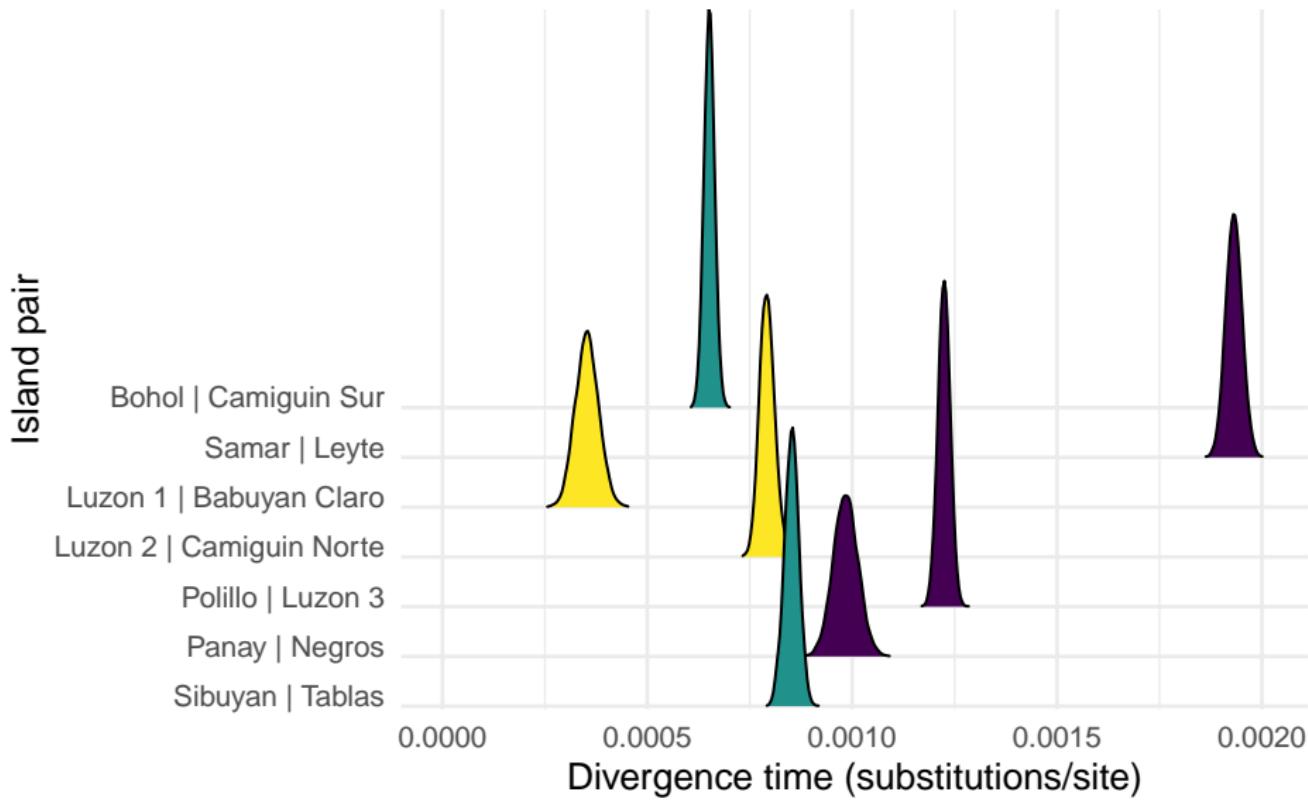

Ecoevolity: Estimating evolutionary coevolutivity

- ▶ Used simulations to assess how well ecoevolity works given the gekkonid RADseq data sets

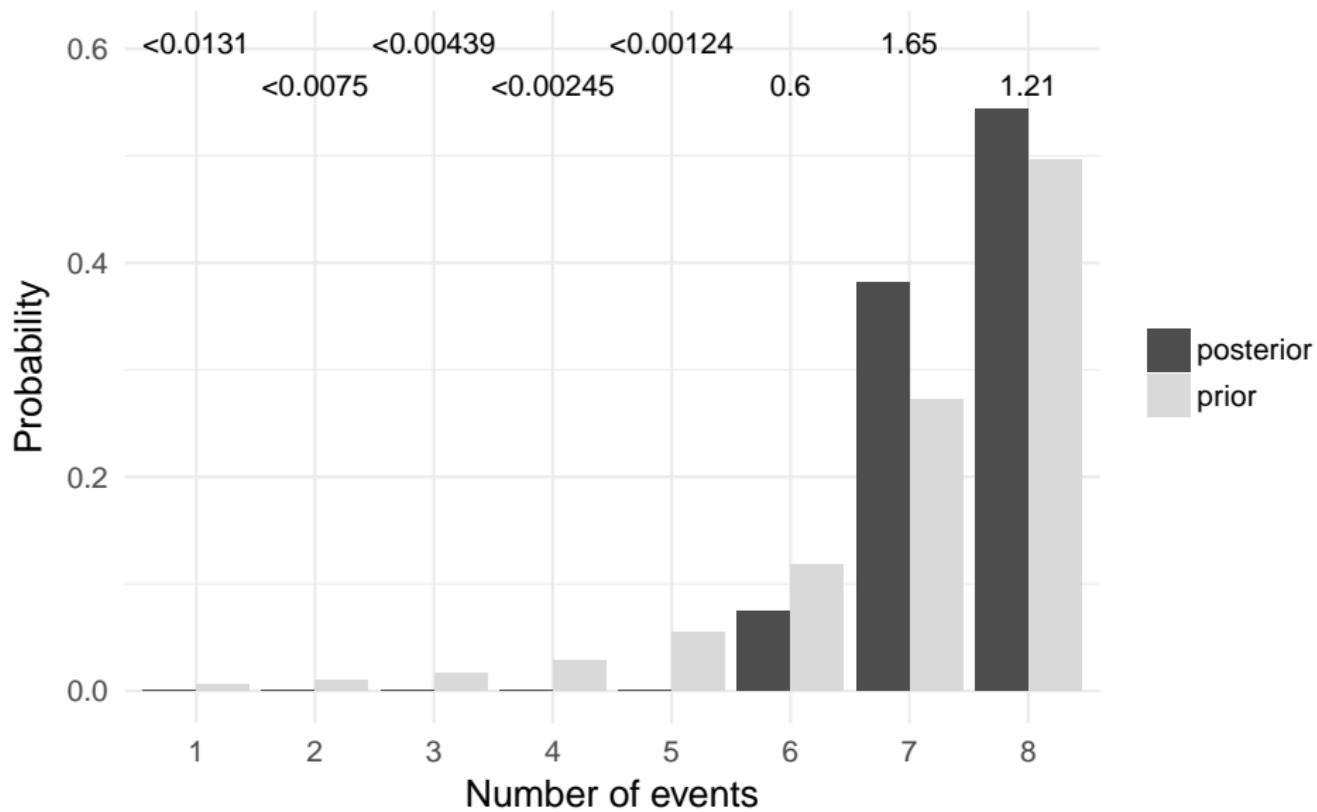

Results: *Cyrtodactylus* (Figure 2)

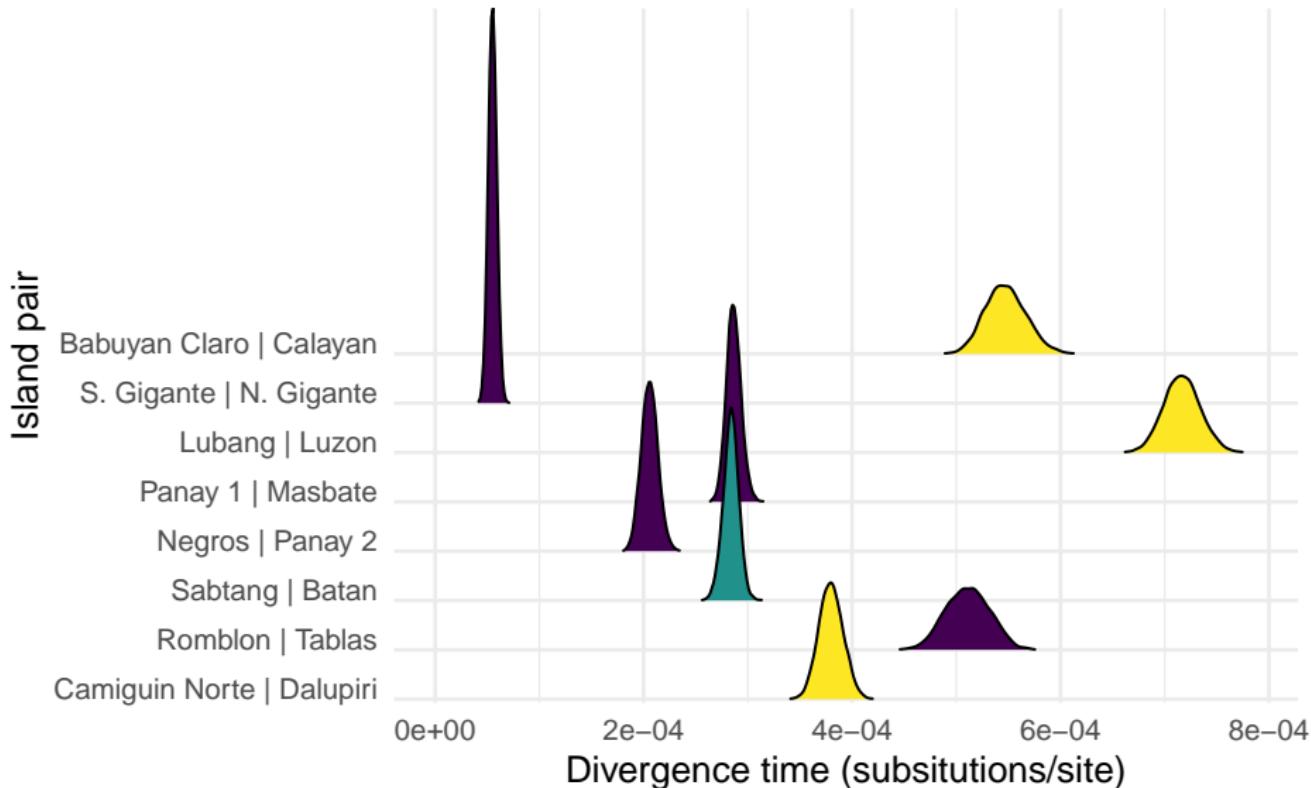

Results: *Cyrtodactylus* (Figure 3)

Results: *Gekko* (Figure 4)

Results: Gekko (Figure 5)

Key findings

- ▶ Strong support that all 8 pairs of *Cyrtodactylus* populations diverged independently

Key findings

- ▶ Strong support that all 8 pairs of *Cyrtodactylus* populations diverged independently
- ▶ Weak support that all 8 pairs of *Gekko* populations diverged independently

Key findings

- ▶ Strong support that all 8 pairs of *Cyrtodactylus* populations diverged independently
- ▶ Weak support that all 8 pairs of *Gekko* populations diverged independently
- ▶ Simulation results suggest ecoevolity can accurately estimate the timing and number of divergences given the gekkonid RADseq data

Caveats

- ▶ Too few island pairs to rule out climate-driven vicariant speciation
- ▶ Differences in divergence times could be due to variation in fragmentation times among island pairs
- ▶ Differences in divergence could also be due to variation in mutation rates

Caveats

- ▶ Too few island pairs to rule out climate-driven vicariant speciation
 - ▶ Differences in divergence times could be due to variation in fragmentation times among island pairs
 - ▶ Differences in divergence could also be due to variation in mutation rates
-
- ▶ Seems safe to conclude that the “species-pump” is not the rule for gekkonids, but maybe the exception

Take home points

- ▶ Support against the “species-pump” hypothesis

Take home points

- ▶ Support against the “species-pump” hypothesis
- ▶ Results suggest repeated cycles of climate-driven island fragmentation were not an important mechanism of speciation for gekkonid lizards in the Philippines

Take home points

- ▶ Support against the “species-pump” hypothesis
- ▶ Results suggest repeated cycles of climate-driven island fragmentation were not an important mechanism of speciation for gekkonid lizards in the Philippines
- ▶ Rare over-water dispersal via rafting on vegetation is likely an important mechanism responsible for the distribution of gekkonid lizards in the Philippines
