b)

Growing and measurement scheme

(a) Mutant and overexpression lines and wild type controls used in this study. Shown are the affected loci, mutant name, devision in sub-groups for analyses, the T-DNA or construct identifier, the type of mutant, and reference to the paper in which the lines were initially described. The number in the column on the right is a unique identifier, which is used as reference in all graphs. (b) Shows how the measurements were scheduled during each 24 hr cycle in the rosette stage. Day time is depicted in yellow and night time in grey. Measurements include near infrared reflectance (NIR) and pulse-amplitude-modulation (PAM), as measure for Φ_{PSII} .
