Supplementary Table One. Profile of fatty acids present in explants of placenta from uncomplicated pregnancies (n=6). The mean (SD) amount of each fatty acid as percentage weight of total fatty acids in placental explants cultured in 5 mM or 25 mM D-glucose for 24 h is shown. Data were analysed using the Wilcoxon-matched pairs test; no statistically significant differences were detected.

Supplementary Table Two. Profile of fatty acids present in placentas from women with pregnancies complicated by type 1 diabetes ($n=6$), type 2 diabetes ($n=6$) and BMI-matched uncomplicated pregnancies ($BMI \leq 30$, $n=6$; $BMI \geq 30$, $n=6$). The mean (SD) amount of each fatty acid as percentage weight of total fatty acids is shown. Data were analysed using the Kruskal-Wallis test; no statistically significant differences were detected.
