

Title

Acquisition of a side population fraction augments malignant phenotype in ovarian cancer.

Supplementary Figure

Figure. S1

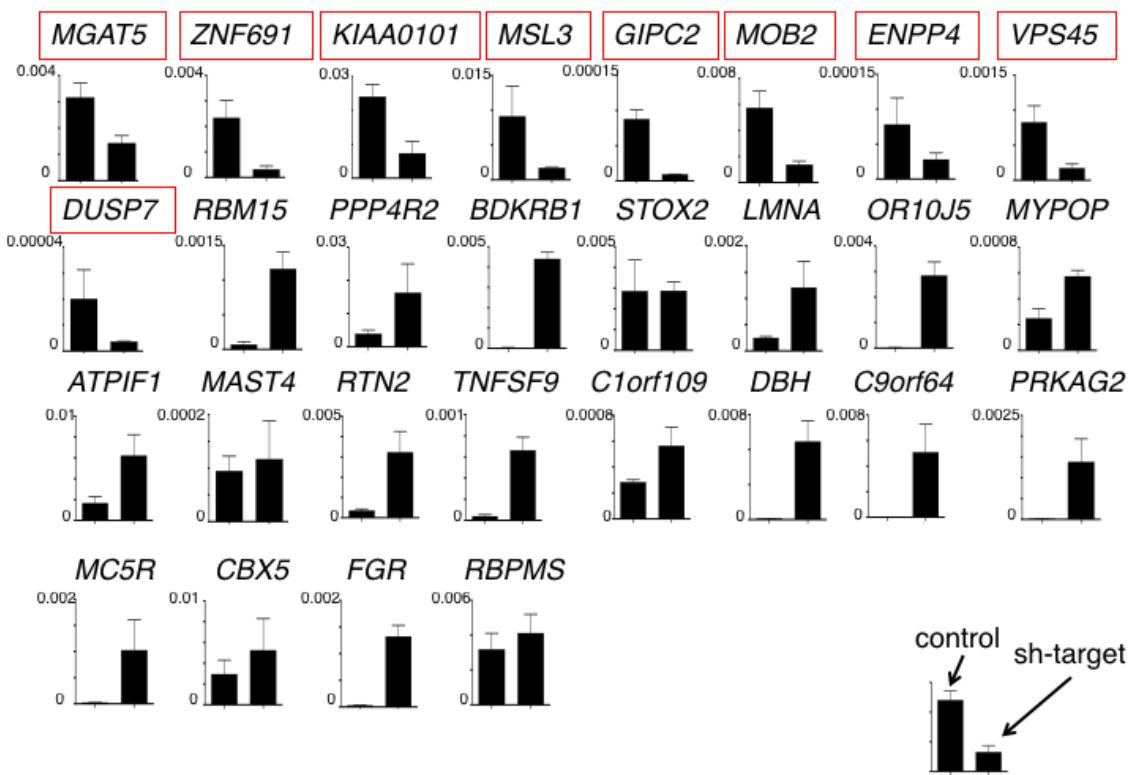

Supplementary Fig. S1. SP fraction of several ovarian cancer cell lines.

Representative data showing the percentage of the SP fraction of CH1, SKOV3, A2780

and IGROV1. SP fraction is marked with red line.

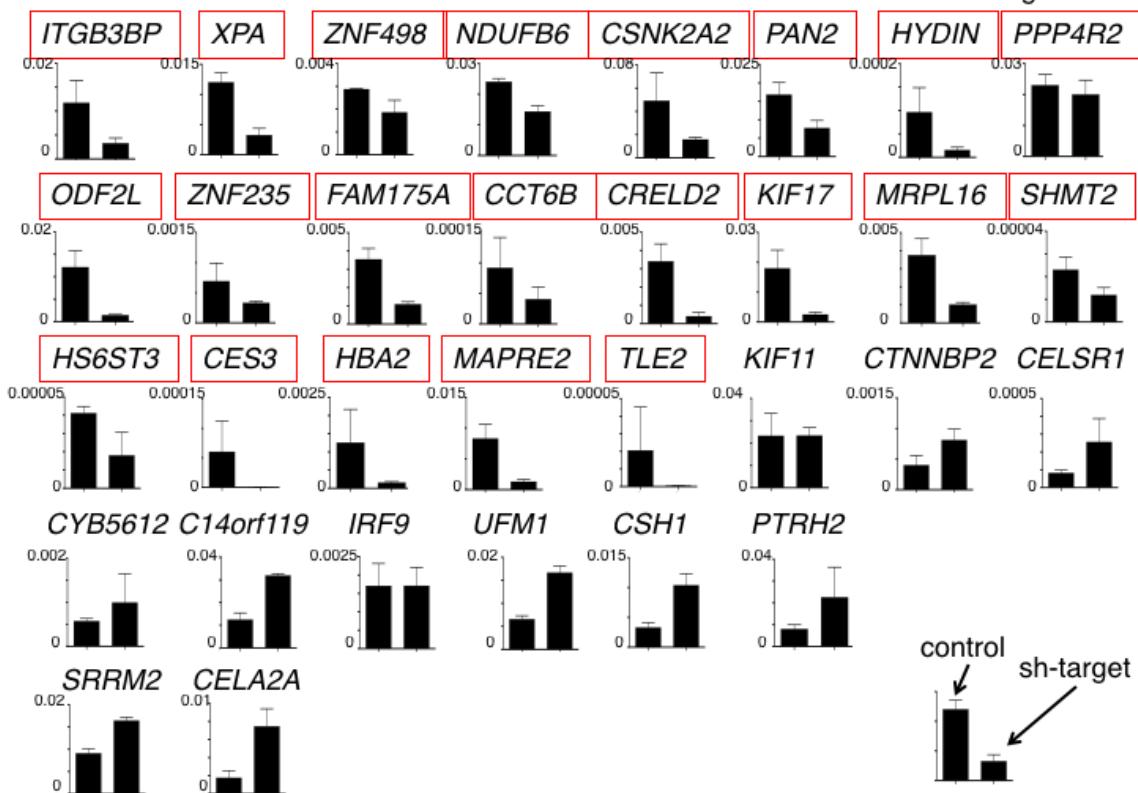

Figure. S2

Supplementary Fig. S2. Confirmation of mRNA expression.

RT-PCR showing knockdown of shRNA target genes for the shRNAs that markedly increased the SP fraction in CH1 cells. Red outline indicates that the target gene expression is significantly suppressed.

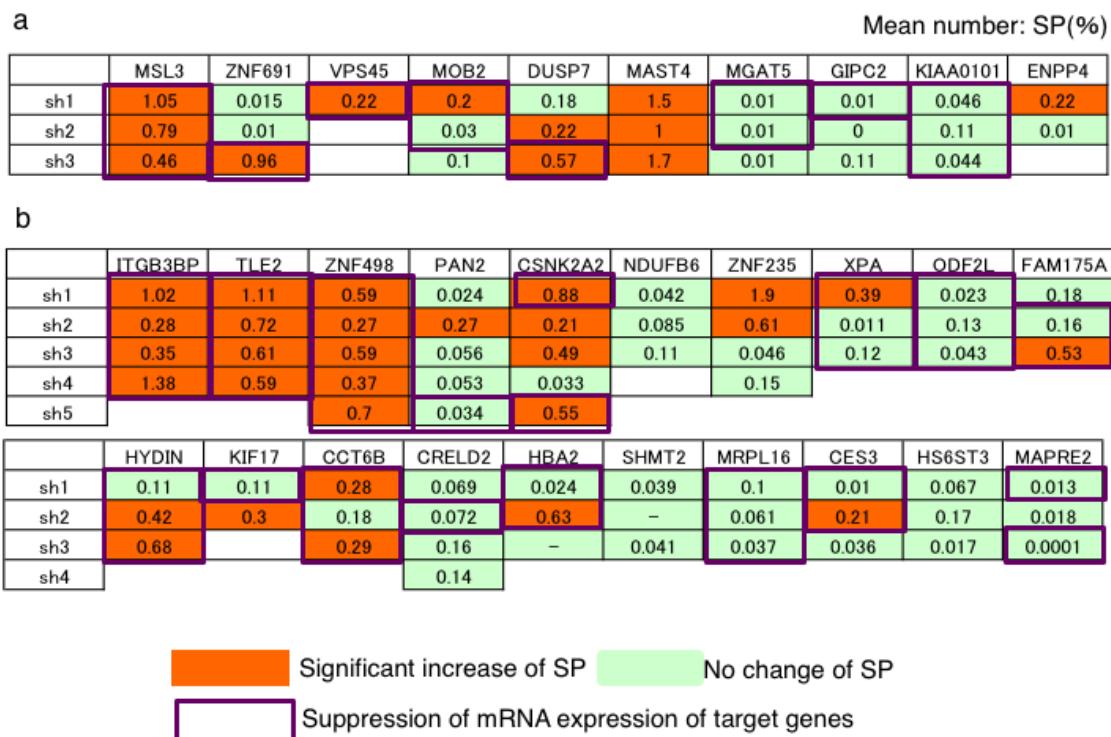

Figure. S3

Supplementary Fig. 3. Confirmation of mRNA expression.

RT-PCR showing knockdown of shRNA target genes for the shRNAs that markedly increased the SP fraction in SKOV3 cells. Red outline indicates that target gene expression is significantly suppressed.

Figure. S4

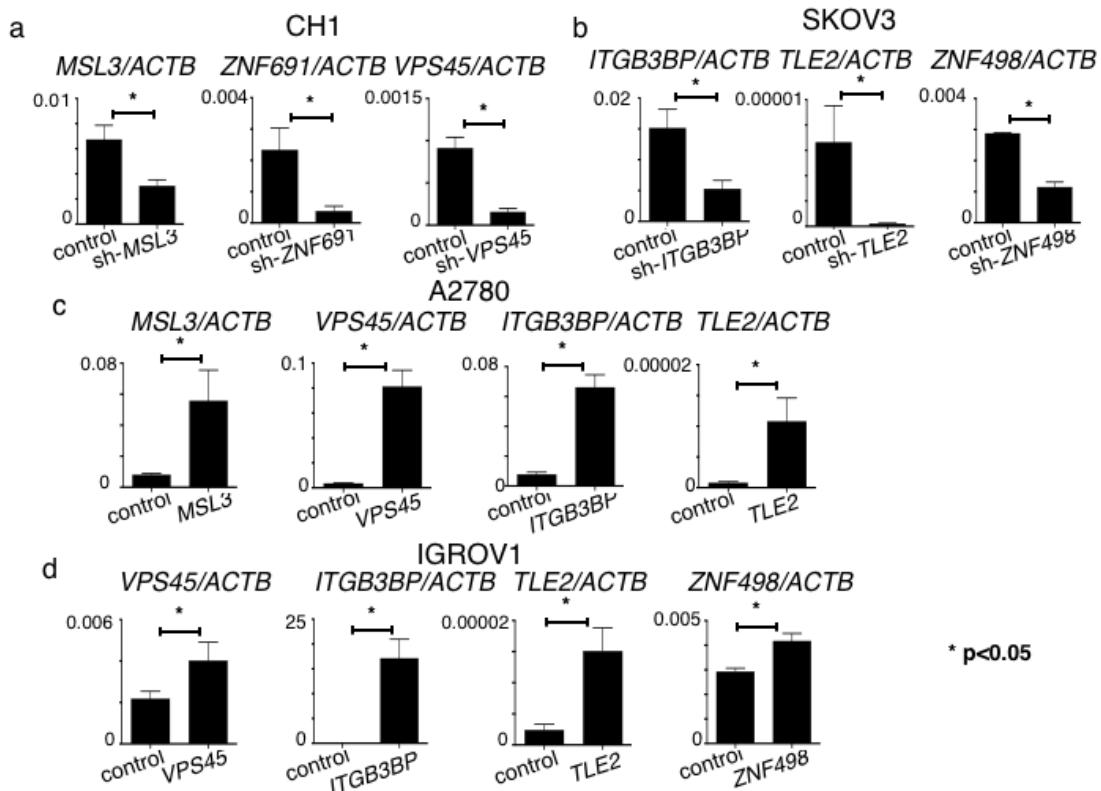

Supplementary Fig. 4. Excluding off target effects and identifying six genes.

We excluded off target effects and identified six genes whose suppression markedly increased the SP fraction. Red shading indicates a significant increase ( $p<0.05$ ) of SP cells as compared to the controls. The purple outline indicates significant suppression ( $p<0.05$ ) of mRNA expression as detected by RT-PCR.

a) Analysis using CH1 cells.

b) Analysis using SKOV3 cells.

Figure. S5

Supplementary Fig. 5. Establishment of cell lines with altered expression of the six target genes.

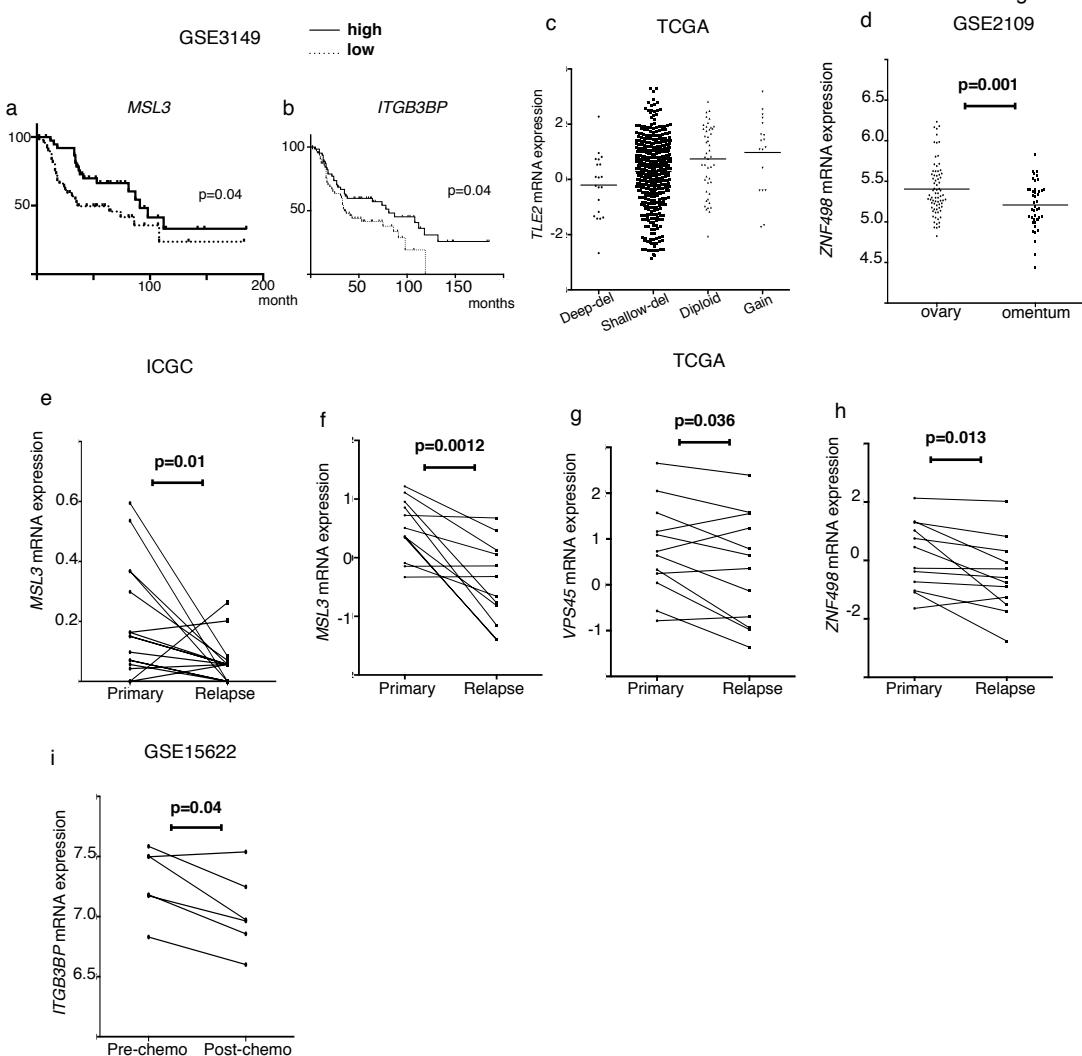

Target gene mRNA suppression or overexpression was measured by RT-PCR.

- Establishment of CH1 clones whose mRNA expression for *MSL3*, *ZNF691* or *VPS45* is suppressed by shRNAs.
- Establishment of SKOV3 clones whose mRNA expression for *ITGB3BP*, *TLE2* or *ZNF498* is suppressed by shRNAs.
- Establishment of A2780 clones with elevated mRNA expression for *MSL3*, *VPS45*, *ITGB3BP* or *TLE2*.

d) Establishment of IGROV1 clones with elevated mRNA expression for *VPS45*,  
*ITGB3BP*, *TLE2* or *ZNF498*.

\*; p<0.05.

Figure S6

Supplementary Fig. 6. Analyses of the clinical data of the six genes.

a) Overall survival of ovarian cancer patients in data set GSE3149. Differences in survival based on *MSL3* mRNA expression are shown. The low expression group consisted of the 50 cases with the lowest level of expression while the high expression group consisted of the 50 cases with the highest level of expression.

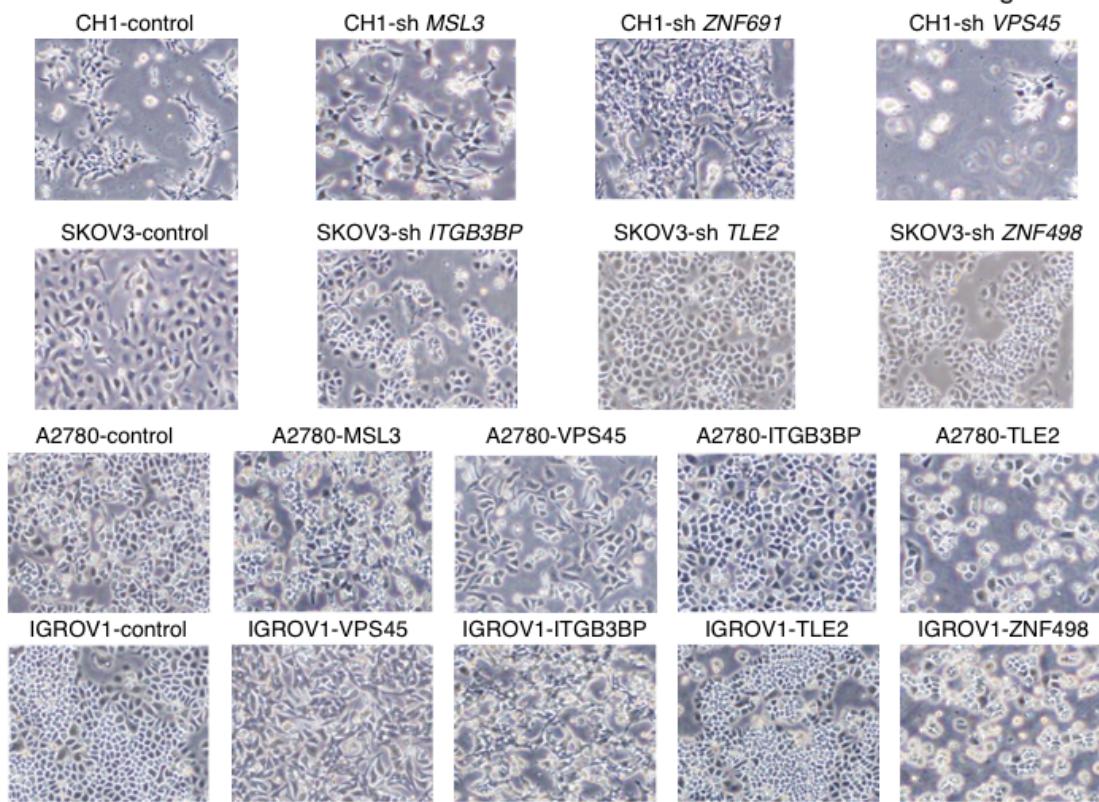

b) Overall survival of ovarian cancer patients in data set GSE3149. Differences in survival

based on *ITGB3BP* mRNA expression are shown. Samples were stratified into two groups based on the median of mRNA expression.

- c) Copy number alterations of *TLE2* in TCGA samples. del; deletion.
- d) Comparison of *ZNF498* mRNA expression between ovarian cancer tissues from the primary site (n=75) and that from disseminated sites (n=45) using gene expression microarray dataset GSE2109.
- e) Change in *MSL3* mRNA expression levels between pre-chemotherapy and post-chemotherapy paired samples (n=17) from dataset ICGC.
- f~h) Analysis using primary and relapsed paired samples (n=12) from dataset of TCGA.
- f) Change in *MSL3* mRNA expression.
- g) Change in *VPS45* mRNA expression.
- h) Change in *ZNF498* mRNA expression.
- i) Change in *ITGB3BP* mRNA expression levels between pre-paclitaxel treatment and post-paclitaxel treatment paired samples (n=6) from dataset GSE15622.

The details of each dataset are described in Supplementary Material and Method.

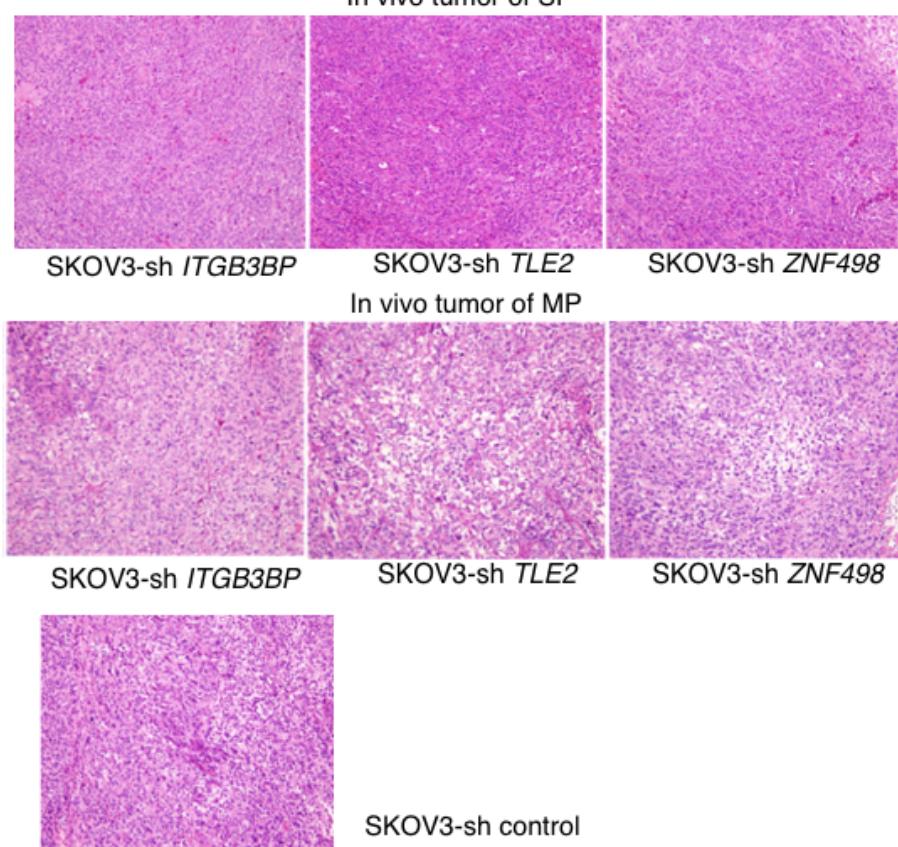

Figure. S7

Supplementary Fig. 7: Alteration of mRNA expression of the six target genes changes cell morphology in vitro.

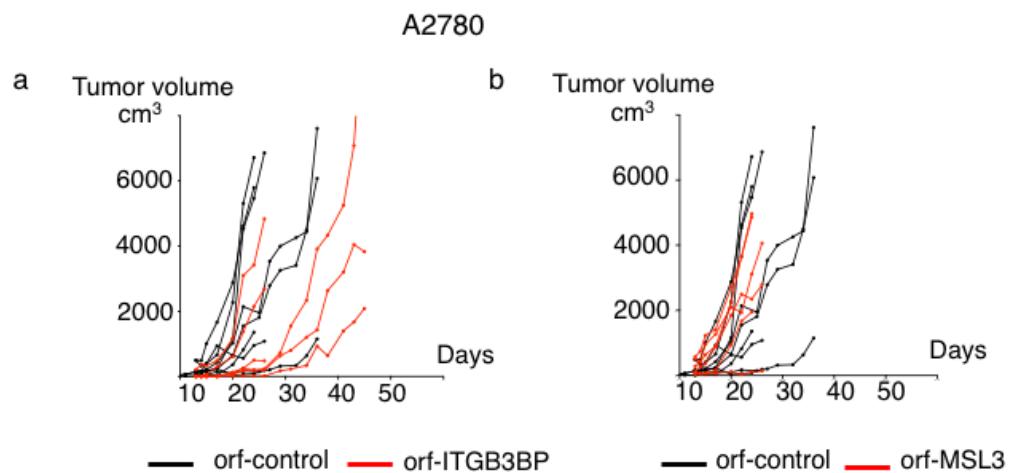

For typically spindle-shaped SKOV3, suppression of *ITGB3BP*, *TLE2*, and *ZNF498* led to a cobblestone appearance (Supplementary Fig. S8). For cobblestone shaped A2780 cells, overexpression of *MSL3* and *VPS45* changed the morphology to spindle shaped. For cobblestone shaped IGROV1, overexpression of *VPS45* and *ITGB3BP* changed the cell morphology to spindle.

Figure. S8

Supplementary Fig. 8. Sections from in vivo tumors formed by newly generated SP cells derived from suppression of *ITGB3BP*, *TLE2* and *ZNF498* exhibit different morphology from those of MP or control cells.

Figure. S9

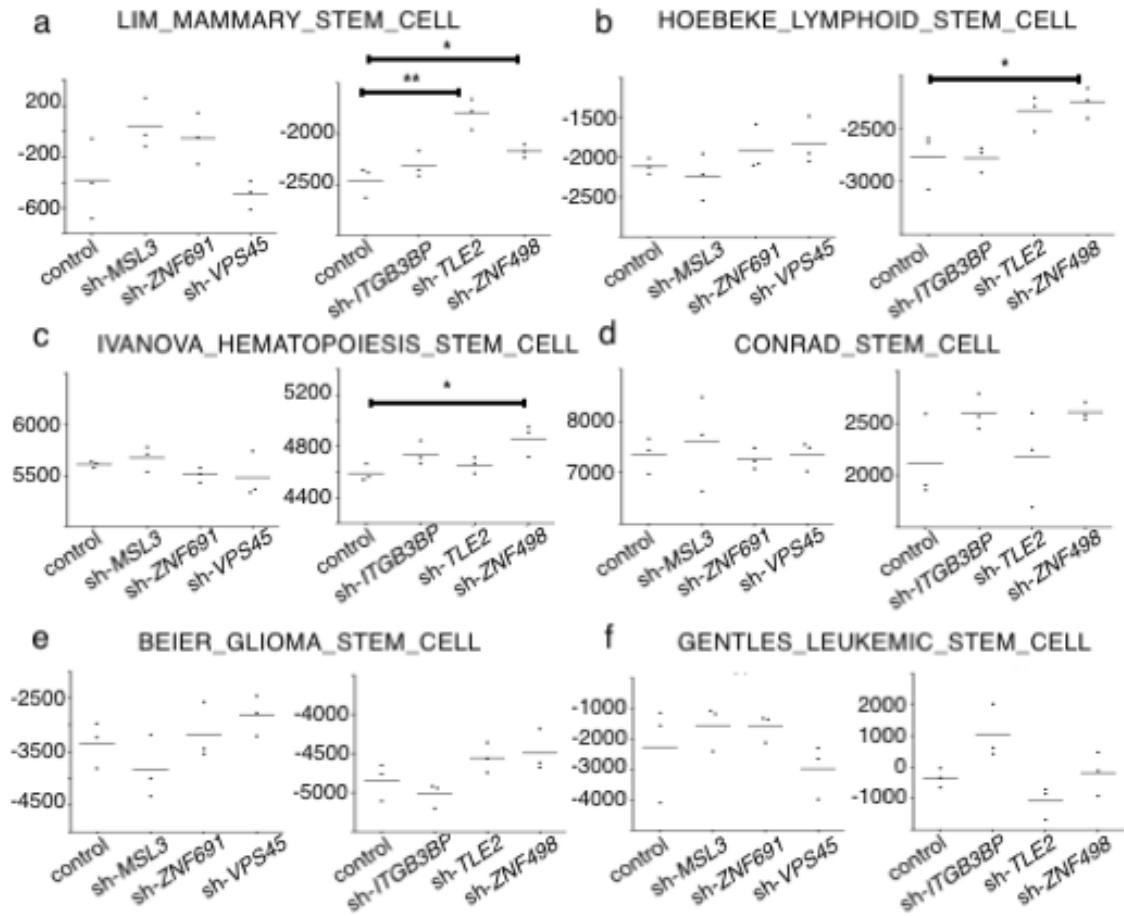

Supplementary Fig. 9. Overexpression of six genes regulates in vivo tumor proliferation.

- a) Tumor growth curves from injection of  $1 \times 10^5$  A2780 control cells and A2780 ORF-ITGB3BP. Overexpression of ITGB3BP tended to decrease in vivo proliferation ability.
- b) Tumor growth curves from injection of  $1 \times 10^5$  A2780 control cells and A2780 ORF-MSL3.

X-axis, days post-injection; Y axis, tumor volume.

**Figure. S10**

Supplementary Fig. 10. Suppression of six target genes can enhance the CSC phenotype.

ssGSEA analyses are shown. Comparison of ssGSEA scores for CH1-shcontrol, sh-MSL3, sh-ZNF691 and sh-VPS45 samples, and for SKOV3-shcontrol, sh-ITGB3BP, sh-TLE2 and sh-ZNF498 samples (n=3, each). Signatures related to CSC phenotype were analyzed. \*\*p<0.01 \*p<0.05

(a) Signature of LIM\_MAMMARY\_STEM\_CELL

(b) Signature of HOEBEKE\_LYMPHOID\_STEM\_CELL

(c) Signature of IVANOVA\_HEMATOPOIESIS\_STEM\_CELL

(d) Signature of CONRAD\_STEM\_CELL

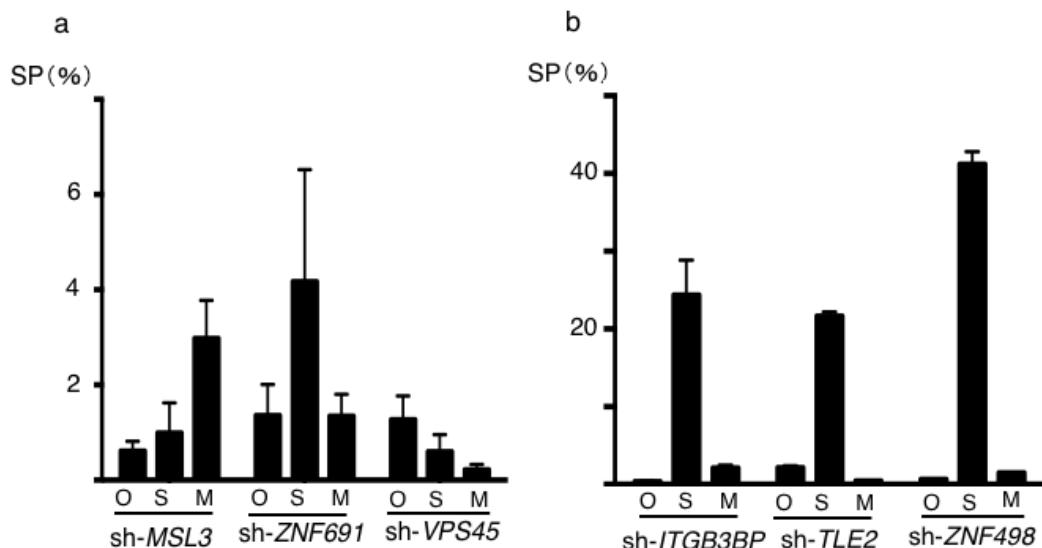

(e) Signature of BEIER\_GLIOMA\_STEM\_CELL

(f) Signature of GENTLES\_LEUKEMIC\_STEM\_CELL

We performed a transcriptome analysis and investigated potential CSC-like functions. We extracted RNA from samples of the CH1-sh-control, CH1-sh-MSL3, CH1-sh-ZNF691, CH1-sh-VPS45, SKOV3-sh-control, SKOV3-sh-ITGB3BP, SKOV3-sh-TLE2, and SKOV3-sh-ZNF498 followed by RNA sequencing (n=3 each). Using this data, we calculated the scores of stem cell-related gene signatures by ssGSEA. We found that the gene sets, CONRAD\_STEM\_CELL, BEIER\_GLIOMA\_STEM\_CELL, GENTLES\_LEUKEMIC\_STEM\_CELL, LIM\_MAMMARY\_STEM\_CELL, HOEBELE LYMPHOID\_STEM\_CELL, and IVANOVA\_HEMATOPOIESIS\_STEM\_CELL, tended to increase with suppression of the six genes (a-f). In particular, the score of the LIM\_MAMMARY\_STEM\_CELL signature was significantly higher in the sh-TLE2 group compared to the control group (a, p=0.006). The scores of the LIM\_MAMMARY\_STEM\_CELL, HOEBEKE LYMPHOID\_STEM\_CELL and IVANOVA\_HEMATPPOIESIS\_STEM\_CELL signatures were significantly higher in the sh-ZNF498 group compared to the control group (a-c; p=0.038, 0.043, 0.03, respectively).

Figure. S11  
Asymmetrical division

O: original S: 2<sup>nd</sup>\_SP M: 2<sup>nd</sup>\_MP

Supplementary Fig. 11. Asymmetric cell division ability was assessed.

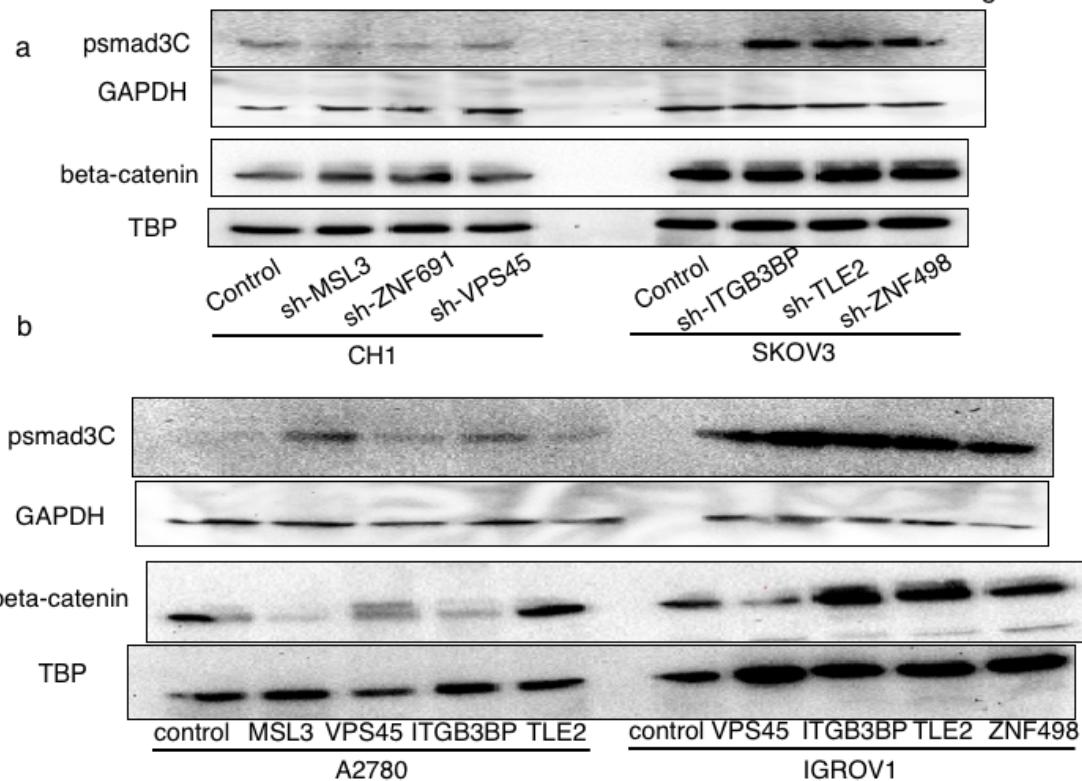

a) Analysis of CH1 cells.

b) Analysis of SKOV3 cells. The SP fraction was significantly enriched in 2<sup>nd</sup>\_SP. SP cells can be detected in 2<sup>nd</sup>\_MP cells.

We investigated asymmetrical division capacity. We sorted the SP and MP fractions separately, followed by two weeks culture in normal cell culture conditions, and established 2<sup>nd</sup> generation-SP and 2<sup>nd</sup> generation-MP cells, and analyzed the proportion of the SP cells of the 2<sup>nd</sup> generation. As a result, the proportion of the SP cells of the 2<sup>nd</sup> generation-SP derived from the three genes suppressed SKOV3 cells were markedly enriched (a). However, the proportion of the SP cells of the 2<sup>nd</sup> generation-MP cells were

almost the same as that of the original three genes-suppressed SKOV3 cells (a). For CH1, we found that the proportion of the SP cells of the 2<sup>nd</sup> generation-MP cells was not different from that of the original three genes-suppressed CH1 cells (b).

Figure S12

Supplementary Fig. 12. Several of the six target genes regulate TGF- $\beta$  pathway and Wnt pathway activity.

The TGF- $\beta$  pathway was assessed by phosphorylation of Smad3C using Western blotting.

The Wnt pathway was assessed by  $\beta$ -catenin nuclear accumulation using Western blotting.

All experiments were performed in triplicate.

a) Representative image of Western blotting in control cells and cells with repression of sh-target genes for both CH1 and SKOV3. Phosphorylation of Smad3C is markedly increased by suppression of *ITGB3BP*, *TLE2* and *ZNF498* in SKOV3 cells. Slight  $\beta$ -catenin nuclear accumulation was evident with suppression of *MSL3*.

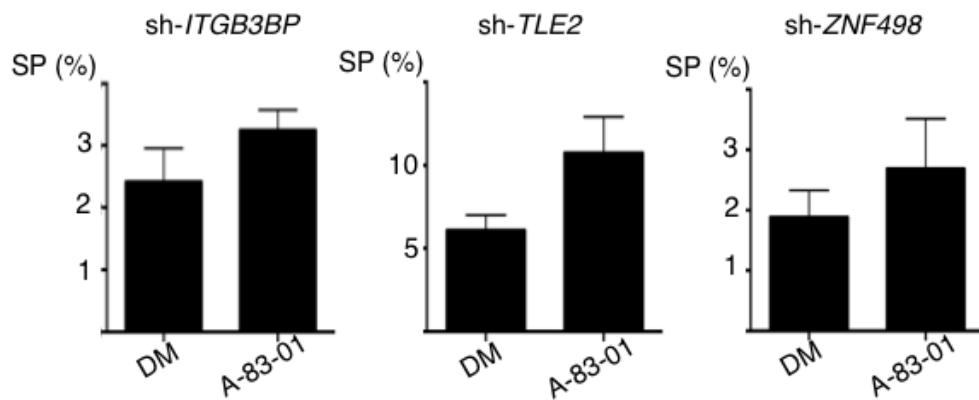

b) Representative Western blotting for A2780 and IGROV1 with control cells and cells with overexpression of target genes. Phosphorylation of Smad3C is not decreased by overexpression of five genes. Overexpression of *MSL3* and *VPS45* markedly decreased nuclear  $\beta$ -catenin accumulation.

The details of western blotting method are described in supplementary Material and Method.

See Supplementary Figure 14 for full image of the blots.

Figure. S13

SKOV3

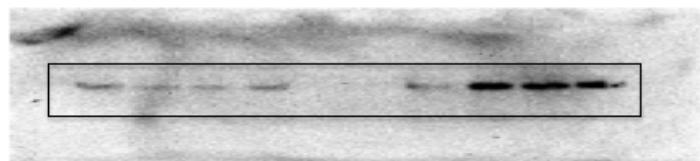

Supplementary Fig. 13. Inhibition of the TGF- $\beta$  pathway does not decrease the SP fraction that was generated by suppression of *ITGB3BP*, *TLE2* and *ZNF498*.

DM; DMSO (control). A-83-01 (Sigma-Aldrich, St.Louis, USA): Inhibitor of TGF- $\beta$  pathway, which was used to inhibit the TGF- $\beta$  pathway.

Supplementary Table S3; GSEA analysis about TGF- $\beta$ , Wnt and Notch pathway

Orange shadow indicates ES positive and FDR q val &lt; 0.25.

Light green shadow indicates ES negative and FDR q val &lt; 0.25.

a) Analysis about TGF- $\beta$  pathway.

## Supplementary Material and Method

### **Stable knockdown and overexpression of target genes**

To establish stable cells that overexpress some target genes, we generated the lentiviral open reading frame (ORF) plasmids by editing the LentiORF plasmids (GE Healthcare Life Science).

First, we purchased the ORF of the target genes from Kazusa RNA Res Inst. Chiba, Japan. We amplified the ORFs by PCR. Cycling parameters were 98°C for 5 minutes, followed by 30 cycles of 98°C for 10 seconds, 63°C for 10 seconds and 72°C for 30 seconds, followed by 72°C for 10 minutes. As a cloning vector, we enzymatically cut precision LentiORF at the XbaI site. We subcloned PCR amplicons into the cloning vector using the InFusion Kit as recommended by the manufacturer, thus generating the lentiviral ORF plasmids. We transfected these into cells as recommended by the manufacturer. Stably transfected cells were selected with blasticidin (10 µg/ml, Thermo Fisher Scientific). All primers are listed in Table S4 and were purchased from Greiner.

### **Gene expression microarray datasets and copy number dataset**

Microarray datasets were obtained from the Gene Expression Omnibus website (<http://www.ncbi.nlm.nih.gov/geo>). The International Cancer Genome Consortium dataset includes 111 samples from 94 HGSOC patients. RNAseq data and patient information were downloaded from the ICGC website. We used datasets GSE2109, TCGA, and GSE3149 to analyze overall survival. To analyze mRNA expression of the primary site and disseminated site, we used the GSE2109 dataset

which contained 75 primary HGSOCs and 43 disseminated HGSOC tumor samples. To analyze the influence of chemotherapy, we used the ICGC and GSE15622 datasets. The ICGC dataset contains 17 paired samples obtained before and after chemotherapy. GSE15622 is a gene expression microarray dataset composed of laparoscopic biopsy specimens from ovarian cancers that were subsequently treated with paclitaxel monotherapy (n=20) or carboplatin monotherapy (n=15). Among them, six patients showed resistance to paclitaxel. To analyze the copy number alterations in the HGSOC samples in TCGA, the cBioPortal for Cancer Genomics database (<http://www.cbioportal.org/public-portal/>) was used.

## **RNA sequencing**

### ***Library preparation and sequencing***

mRNA was converted into a library of template molecules suitable for subsequent cluster generation using the Illumina TruSeq RNA Sample Preparation Kit v2. The first step in the workflow involves purifying the poly-A containing mRNA molecules using poly-T oligo-attached magnetic beads. Following purification, the mRNA is fragmented into small pieces using divalent cations under elevated temperature. The cleaved RNA fragments are copied into first strand cDNA using reverse transcriptase and random primers. This is followed by second strand cDNA synthesis using DNA Polymerase I and RNase H. These cDNA fragments then go through an end repair process, the addition of a single ‘A’ base, and then ligation of the adapters. The products are then

purified and enriched with PCR to create the final cDNA library. The libraries were sequenced on an Illumina HiSeq 2500 platform in paired-end 100 bp configuration.

### ***Transcriptome analysis***

Adapter and low-quality sequences were removed by cutadapt (v1.2.1) (1). After quality control, poly-A/T sequences were also removed by PRINSEQ (v0.19.2) (2). For gene expression analysis, the trimmed reads were aligned to the reference human genome (GRCh37/hg19) using TopHat (v2.0.13) (3). Mapped reads were assembled by Cufflinks (v2.2.1) (4), and the transcripts across all samples were merged by Cuffmerge, a part of the Cufflinks package. The “fragments per kilobase per million map reads” (FPKM) was calculated with Cuffquant, and differential expression analysis (calculating fold change and testing the statistical significance) between samples was performed with Cuffdiff (Cuffquant and Cuffdiff are programs involved in the Cufflinks package).

### **Western Blotting**

Nuclear protein was extracted using NE-PER Nuclear and Cytoplasmic Extraction Reagents (Thermo Fisher Scientific) according to the manufacturer’s protocol. Western blotting was performed as previously described<sup>13</sup>. Primary antibodies included anti-phospho smad3C rabbit polyclonal antibody (1:1000, Immuno-Biology Laboratories, Gunma, Japan), anti-beta catenin rabbit monoclonal antibody (1:1,000, Cell Signal Technology, Danver, USA), anti-TBP rabbit monoclonal antibody (1:1000, Abcam, Cambridge, UK), and anti-GAPDH mouse monoclonal antibody (1:1000,

Abcam). After washing in tris-buffered saline (TBS)-T, the blots were incubated with the appropriate peroxidase-coupled secondary antibody (1:2000; anti-rabbit HRP or anti-mouse HRP, GE Healthcare Life Science). Specific proteins were detected using ECL Plus Western Blotting Reagent (GE Healthcare Life Science). The bands were visualized using the Molecular Imager Gel DocTMXR+ and ChemiDocTMXRS+ Systems with Image Lab 2.0 software (Bio-Rad).
