Is latent tuberculosis infection challenging in Iranian health care workers? A systematic review and meta-analysis --Manuscript Draft--

Manuscript Number:	PONE-D-19-18112
Article Type:	Research Article
Full Title:	Is latent tuberculosis infection challenging in Iranian health care workers? A systematic review and meta-analysis
Short Title:	LT BI among HCWs in Iran
Corresponding Author:	Alireza Jafari Inflammatory Lung Disease Research Center Rasht, IRAN, ISLAMIC REPUBLIC OF
Keywords:	Latent Tuberculosis; Health Personnel; Iran
Abstract:	BaBackground: Latent tuberculosis infection (LTBI) has been changed to one of the challenges of health care workers (HCWs) in low middle-income countries. Method: Search strategies that were lead through Persian (national) databases include SID, Barakat knowledge network system; Irandoc, Magiran; Iranian national library. The international database was Web of science, Scopus, PubMed/MEDLINE, OVID, EMBASE, the Cochrane library, and Google Scholar search engine. The Persian and the English languages were used as the filter in national and international databases, respectively. Searching was done through MeSH terms. The search terms were conducted till January 01, 2019. Results: The prevalence of LTBI in Iranian HCWs, based on the PPD test was (27.13% [CI95%: 18.64-37.7]). The highest prevalence of LTBI in HCWs were estimated (41.4 % [CL95%: 25.4-59.5] in the north, and (33.8% [CI95%: 21.1-49.3]) in the west of Iran. The lowest prevalence of LTBI in HCWs who had work-experience more than 20 years old were estimated (20.49% [CI95%: 11-34.97]). In the PPD test, the prevalence of LTBI in HCWs who had received the Bacille Calmette–Guérin (BCG) was estimated (15% [CI 95%: 3.6-47.73]). While, in the QFT, the prevalence of LTBI in HCWs in non-vaccinated was estimated (25.71% [CI95%: 13.96-42.49]). Conclusions: This meta-analysis shows the highest prevalence of LTBI in HCWs in the north and the west of Iran due to neighboring countries like Azerbaijan and Iraq, respectively. Hence, Iranian HCWs do not fully understand the isolation and personal protection. We also found that BCG was not able to protect Iranian HCWs from TB infections, completely.

Consult the submission guidelines for	
detailed instructions. Make sure that all information entered here is included in the	
Methods section of the manuscript.	

Format for specific study types

Human Subject Research (involving human participants and/or tissue)

- Give the name of the institutional review board or ethics committee that approved the study
- Include the approval number and/or a statement indicating approval of this research
- Indicate the form of consent obtained (written/oral) or the reason that consent was not obtained (e.g. the data were analyzed anonymously)

Animal Research (involving vertebrate

animals, embryos or tissues)

- Provide the name of the Institutional Animal Care and Use Committee (IACUC) or other relevant ethics board that reviewed the study protocol, and indicate whether they approved this research or granted a formal waiver of ethical approval
- Include an approval number if one was obtained
- If the study involved non-human primates, add additional details about animal welfare and steps taken to ameliorate suffering
- If anesthesia, euthanasia, or any kind of animal sacrifice is part of the study, include briefly which substances and/or methods were applied

Field Research

Include the following details if this study involves the collection of plant, animal, or other materials from a natural setting:

- Field permit number
- Name of the institution or relevant body that granted permission

Data Availability

Authors are required to make all data underlying the findings described fully available, without restriction, and from the time of publication. PLOS allows rare exceptions to address legal and ethical concerns. See the <u>PLOS Data Policy</u> and FAQ for detailed information.

Yes - all data are fully available without restriction

A Data Availability Statement describing where the data can be found is required at submission. Your answers to this question constitute the Data Availability Statement and will be published in the article , if accepted. Important: Stating 'data available on request from the author' is not sufficient. If your data are only available upon request, select 'No' for the first question and explain your exceptional situation in the text box. Do the authors confirm that all data underlying the findings described in their manuscript are fully available without restriction?	
 Describe where the data may be found in full sentences. If you are copying our sample text, replace any instances of XXX with the appropriate details. If the data are held or will be held in a public repository, include URLs, accession numbers or DOIs. If this information will only be available after acceptance, indicate this by ticking the box below. For example: <i>All XXX files are available from the XXX database (accession number(s) XXX, XXX.)</i>. If the data are all contained within the manuscript and/or Supporting Information files, enter the following: <i>All relevant data are within the manuscript and its Supporting Information files.</i> If neither of these applies but you are able to provide details of access elsewhere, with or without limitations, please do so. For example: Data cannot be shared publicly because of [XXX]. Data are available from the XXX Institutional Data Access / Ethics 	All relevant data are within the manuscript and its Supporting Information files.
researchers who meet the criteria for access to confidential data. The data underlying the results presented in the study are available from (include the name of the third party

27 Abstract:

Background: Latent tuberculosis infection (LTBI) has been changed to one of the challenges
of health care workers (HCWs) in low middle-income countries.

Method: Search strategies that were lead through Persian)national(databases include SID, Barakat knowledge network system; Irandoc, Magiran; Iranian national library. The international database was Web of science, Scopus, PubMed/MEDLINE, OVID, EMBASE, the Cochrane library, and Google Scholar search engine. The Persian and the English languages were used as the filter in national and international databases, respectively. Searching was done through MeSH terms. The search terms were conducted till January 01, 2019.

Results: The prevalence of LTBI in Iranian HCWs, based on the PPD test was (27.13%) 37 38 [CI95%: 18.64-37.7]). The highest prevalence of LTBI in HCWs were estimated (41.4 % 39 [CL95%: 25.4-59.5] in the north, and (33.8% [CI95%: 21.1-49.3]) in the west of Iran. The 40 lowest prevalence of LTBI was evaluated (18.2% [CI95%: 3.4-58.2]) in the south of Iran. 41 The prevalence of LTBI in HCWs who had work-experience more than 20 years old were 42 estimated (20.49% [CI95%: 11-34.97]). In the PPD test, the prevalence of LTBI in HCWs who had received the Bacille Calmette-Guérin (BCG) was estimated (15% [CI 95%: 3.6-43 47.73]). While, in the QFT, the prevalence of LTBI in HCWs in non-vaccinated was 44 45 estimated (25.71% [CI95%: 13.96-42.49]).

46 Conclusions: This meta-analysis shows the highest prevalence of LTBI in HCWs in the north
47 and the west of Iran due to neighboring countries like Azerbaijan and Iraq, respectively.
48 Hence, Iranian HCWs do not fully understand the isolation and personal protection. We also

49 found that BCG was not able to protect Iranian HCWs from TB infections, completely.

50

51 Keywords: Latent Tuberculosis; Health Personnel; Iran

52 **1. Introduction**:

53 Latent tuberculosis infection (LTBI) is an immune response to Mycobacterium 54 tuberculosis (Mtb) antigens without symptoms of active tuberculosis (TB) [1]. Mtb is able to 55 colonize inside the alveolar macrophages and finally form granuloma. Mtb is ingested by phagocytosis by resident alveolar macrophages and tissue dendritic cells (DC) [2, 3]. The 56 57 immune cells contribute and the pathological mark of TB, the granuloma, is formed. In the 58 granuloma, macrophages differentiate into epithelial cells or foamy macrophages, or fuse to 59 form giant cells, and become surrounded by lymphocytes, fibroblasts and extracellular matrix 60 proteins. In such conditions, the Mtb will be surviving until the granuloma fails due to 61 immunosuppression [4, 5]. Mtb use the granuloma as they are effective at initial infection 62 level since they recruit new macrophages to allow the spread of infection between host cells 63 [6]. At this stage, the LTBI is formed in the patient's body.

64 [7]. There are several reports of LTBI outbreaks in Iran; however, the highest prevalence 65 of LTBI has been reported to be 82% in Sistan-Baluchistan province [8]. The risk of 66 tuberculosis in health care workers (HCWs) is estimated to be twice as high in the general 67 population, in high-income countries, and five times higher than the general population in 68 countries with a low and middle income [9, 10].

In addition, one of the challenges in many countries is the transfer of tuberculosis from patients admitted to the hospital to HCWs [10]. Most importantly, the transfer of resistant Mycobacterium tuberculosis strains from admitted patients to HCWs has increased the importance of the subject [11].

According to the findings, direct exposure to HCWs in patients with tuberculosis, direct contact with phlegm specimens and blood products of suspected tuberculosis patients, and long hours of work in high-risk places increases the risk of tuberculosis infection [12, 13]. This means that direct contact is one of the most important and worrisome factor in the transmission of tuberculosis to HCWs [10-12, 14]. Work experience, age [15], occupational
status [16], the use of personal protective equipment, ventilation, hospital Infection Control
Unit and infection control in isolation rooms can affect LTBI outbreaks in HCWs [9-12]., T
[17]. To diagnose LTBI, the Mantoux tuberculin skin test (TST) and QuantiFERON-TB Gold
(QFT) are used [18]. Studies have shown that QFT has a higher sensitivity and specificity in
detecting LTBI [19, 20]. However, some researchers believe that QFT is not superior to TST
in detecting LTBI [21-23].

84 The early detection of LTBI in controlling, treating and preventing Mtb is a key element 85 in patients. So that preventive treatment can reduce the risk of active tuberculosis in patients by up to 90% [24]. So far, systematic review and meta-analysis has not been conducted to 86 87 evaluate the prevalence and risk factors of LTBI among HCWs in Iran. In Iran, the Centers 88 for Disease Control and Prevention (CDC) do not control the Mtb as a regular program, 89 however, reports of LTBI outbreaks in HCWs attracts a high controversy [25]. Due to the highest level of evidence and an essential role in evidence-based decision-making of meta-90 analysis studies [26, 27], this study estimated the prevalence and risk factors of LTBI among 91 92 HCWs in Iran which can have vital information for policy-makers and planning at the country level. 93

94

95 **2. Materials and methods**

96 2.1. Study Protocol

97 This is the first study that was conducted based on the meta-analysis of observational 98 studies according to epidemiology guidelines [27], and the PRISMA (Preferred Reporting 99 Items for Systematic Reviews and Meta-Analyses) statement (S1 File) [28]. The study was 100 achieved based on five steps; design and search strategy; collecting original articles; 101 evaluating inclusion and exclusion criteria, and finally qualitative evaluation and statistical analysis of data. Two independent researchers)MH. YK& A.J(evaluated the data. The 102 103 disagreements were solved by consensus between the team, and a bacteriologist (H.S.E). 104 The review protocol was registered in PROSPERO :International Prospective Register of 105 Systematic Reviews) https://www.crd.york.ac.uk/PROSPERO/) Identifier: 106 CRD42018117682 [29, 30] (S2 File).

107 **2.2. Search strategy**

In order to maximize its sensitivity, search strategy was six lead through Persian 108 109 including scientific information (national) databases, database 110 (SID))http://www.sid.ir/), Barakat knowledge network system 111)http://health.barakatkns.com), Iranian research institute for information science and technology)IranDoc()https://irandoc.ac.ir), Magiran)http://www.magiran.com), Iranian 112 113 national library)http://www.nlai.ir/). The international databases, including web of science, 114 Scopus, PubMed/MEDLINE, OVID, EMBASE, the Cochrane Library)Cochrane Database 115 of Systematic Reviews (, and Google Scholar search engine. he Persian and the English T languages were used as the filter in national and international databases, respectively. The 116 117 search terms were adapted to international databases. To search a combination of words, Boolean operators) AND& OR(were used. hing was done through medical Searc 118 subject heading)MeSH(terms. The search terms were conducted without any time limitation 119

till January 01, 2019. The authors were then independently analyzed the
manuscript contained in the title and abstract. For instance, PubMed search formula was
provided in the appendix.

123 **2.3. Inclusion and exclusion criteria**

124 **2.3.1.** Inclusion criteria based on PICO (related to Evidence-Based Medicine) [31, 32]

(1) <u>P</u>opulation: This study was been concentrated on the population of HCWs with LTBI who were residents in the geographic regions of Northern, Southern, Eastern, Western, center, and capital city of Iran. ;)2(<u>I</u>ntervention: The exposure were the laboratory tests (Interferon-gamma (IFN- γ) release assay (IGRA), and tuberculin skin tests)TST((of which confirmed LTBI among HCWs in Iran. ;)3(<u>C</u>omparison: A population of HCWs who did not have signs of active TB disease and did not feel illness.; (4) <u>O</u>utcome: Estimate the overall prevalence and risk factors of LTBI infection among HCWs in Iran.

132 **2.3.2. Exclusion criteria**

Review articles, letters, editorial, case reports, conference papers, and comments were excluded. The studies of which did not have a focus on the prevalence of LTBI in Iranian HCWs, duplicated papers, non-English full papers, non-Persian full papers, and nonassessable full-text papers were excluded. Likewise, the populations other than Iranian HCWs were excluded.

138 **2.4. Latent TB detection criteria**

139 **2.4.1. The Mantoux tuberculin skin test (TST)**

140 **To** the Mantoux tuberculin skin test (TST), purified protein derivative (0.1 Ml) is used 141 [33-35], and the inducation at TST site is measured 72 hours later. TST reaction of \geq 5 mm of 142 inducation is classified as negative but is considered as positive in patients receiving 143 corticosteroid or patients with Acquired Immunodeficiency Syndrome (AIDS), diabetes 144 mellitus, lymphoma, and leukemia. The induration of ≥ 10 mm is classified positive in; recent 145 immigrants (< 5 years) from high-prevalence countries; residents and employees of high-risk 146 congregate settings; mycobacteriology laboratory personnel; persons with clinical conditions 147 that place them at high risk. The induration of ≥ 15 mm is considered positive in any person, 148 including persons with no known risk factors for TB. Two-step testing methods were used 149 for health care workers and nursing home residents [33-35].

150 **2.4.2. Interferon-gamma release assays**

Interferon-gamma release assays (IGRAs) show how the immune system reacts to the Mycobacteria that cause TB [36]. The IGRA has been approved by the U.S. Food and Drug Administration (FDA). Positive IGRA means that the person has been infected with TB bacteria. Negative IGRA means that the person's blood did not react to the test and that latent TB infection or TB disease is not likely. IGRA is the preferred method of TB infection testing for people who have received the Bacille Calmette–Guérin (BCG) [30, 36-39].

157 **2.5. Selection of studies**

During the selection stage, duplicated studies were removed by the EndNote[™] software Ver. X9 (Clarivate Analytics company). In the skimming and screening stage, co-authors, journals, and publishing years were evaluated by two experts based on inclusion and exclusion criteria (the eligibility stage), independently. The disagreements between the two were resolved through an expert bacteriologist (Figure 1).

163 **Fig 1.** A flow diagram (Stacked Venn) following the PRISMA (Depicted by MH-YK).

164 **2.6. Quality appraisal**

In this stage, the irrelevant studies were excluded, and then the quality of each study was evaluated. To quality appraisal, the Newcastle-Ottawa Scale (NOS) checklist (S3 File)[40] was applied whichdetermined the quality of these studies based on three levels of scoring. The score of five or less defined a poor quality study; the score of five or six distinguished as the medium quality study, and the score of seven or eight determined as the high-quality study. Finally, the medium to high-quality studies were included in the data analysis (Fig 1).

171 Fig 1. A flow diagram (Stacked Venn) following the PRISMA (Depicted by MH-YK).

172 **2.7. Data extraction**

The enter terms were author's names, province, geographical regions, year of publishing, sample size, age ,gender ,history of BCG ,history of exposure with tuberculosis ,history of tuberculosis disease ,laboratory diagnosis tests, job experience, duration of employment, workplaces, single-step or two-step TST, and history of hospitalization. The author's name, institution, and the journal name were blinded, and then data was extracted through two researchers (MH.YK & A.J), independently. Only if necessary, the additional information/raw data was collected by phone call, mailing, or fax.

180 **2.8. Statistical analysis**

181 The prevalence of LTBI in HCWs was considered as a binomial distribution probability, 182 and the variance was calculated by a binomial distribution. To evaluate its heterogeneity, the Cochran test (Q) and I^2 index were used[1, 41, 42]. The subgroup analysis was 183 184 performed based on province, single-step or two-step TST, laboratory diagnosis tests, job, gender, history of TB disease, history of TB exposure, history of BCG, and geographical 185 186 regions. Sensitivity analysis was also achieved to evaluate the impact of each study, based on the results of the overall prevalence of LTBI in Iranian HCWs. The Begg's test and Egger's 187 188 test were carried out using a funnel plot to examine publication bias. Data analysis was 189 examined by the Comprehensive Meta-Analysis Ver .2)Englewood ,NJ 07631, USA((,and 190 level of significance was considered as p<0.05.

191 **3. Results**:

192 **3.1. Study characteristics and methodological quality**

- 193 In the primary search of study, 421 studies were found. After skimming and screening, 20
- 194 (4.75%) studies were eligible according to inclusions and exclusions criteria [43-62]. The
- 195 total sample size was calculated 6453 Iranian HCWs (Fig 1) (S1 Table.(
- 196 **Fig 1.** A flow diagram (Stacked Venn) following the PRISMA (Depicted by MH-YK).

197 **3.2. The overall prevalence LTBI in HCWs**

- 198 The prevalence of LTBI in HCWs, based on the PPD test (48 hours) was (27.13% [CI95%:
- 199 18.64-37.7]) (Fig 2), and based on the QFT test was (16.92% [CI95%: 9.7-27.84]) (Fig 3).
- 200 The prevalence of LTBI was estimated (12.11% [CI95%: 4.53-28.57]) in Iranian HCWs who
- 201 had negative TST reaction (48 hours) in the first week (Fig 4). The prevalence of induration
- 202 at TST site (48 h) was estimated <4 mm in (43.74% [CI 95%: 28.19-60.63]), 5-9 mm in
- 203 (17.52% [CI 95%: 9.73-29.5]), 10-15 mm in (14.55% [CI 95%: 8.87-22.93]) and >15 mm in
- 204 (13.4% [CI 95%: 8.59-20.31]) (S1 Fig).
- 205 Fig 2. The prevalence subgroup analysis (Forest plot Random effect model) based on
- 206 TST/PPD induration diameter (48 hrs.) in HCWs with LTBI.
- Fig 3. The prevalence subgroup analysis (Forest plot Random effect model) based on QFT
 in HCWs with LTBI.
- Fig 4. The prevalence subgroup analysis (Forest plot Random effect model) based on
 TST/PPD inducation diameter after one week in HCWs with LTBI.

3.3. The prevalence of LTBI in Iranian HCWs based on geographical region of Iran

- The highest prevalence of LTBI in HCWs was estimated (41.4 % [CL95%: 25.4-59.5] in
- the north, and (33.8% [CI95%: 21.1-49.3]) in the west of Iran. The lowest prevalence of
- LTBI was evaluated (18.2% [CI95%: 3.4-58.2]) in the south of Iran. These results showed a

significant relationship between LTBI prevalence in HCWs and the geographic location in
Iran (p <0.0001) (S2 Fig) (Fig 5).

Fig 5. Distribution of LTBI in Iranian HCWs based on geographical classification (Random
effect model).

219 **3.4. Sensitivity analysis and cumulative meta-analysis**

Sensitivity analysis of prevalence of LTBI in Iranian HCWs was estimated with a 95%
confidence interval. It showed that there is no significant effect on the overall prevalence of
LTBI in Iranian HCWs (Fig 6). The overall prevalence of LTBI in Iranian HCWs based on
the publication year was estimated by cumulative meta-analysis and represented in (S3 Fig).
Fig 6. Sensitivity analysis to prevalence of LTBI in Iranian HCWs (one study removed test)

Fig 0. Sensitivity analysis to prevalence of ETDT in framal file ws (one study femoved

225 **3.5. Meta-regression**

The prevalence of publishing manuscripts about identification of LTBI in HCWs by the PPD test (48 hours), has decreased in Iran. There was however no significant relationship. (Mixed effects regression (Method of moments); Slope = -0.1898(SE = 0.068, (95% CI: -0.323- -0.056)), Intercept = 381.14 (SE = 137.43, (95% CI: 111.78-650.5)), P = 0.10653)

230 (Fig 7).

Fig 7. Meta-regression of LTBI in Iranian HCWs according to publishing year of studies(method of moments).

3.6. The prevalence of LTBI in HCWs based on term of employment

The prevalence of LTBI in Iranian HCWs with more than 10 years old work-experience was evaluated 51%. The prevalence of LTBI in HCWs with less than 10 years old workexperience was estimated 29.30% in the PPD test. The prevalence of LTBI in HCWs with more than 20 years old work-experience was calculated (20.49% [CI95%: 11-34.97]), which showed a significant relationship between the term of employment in QFT (P <0.0001) (S4
Fig).

240 **3.7.** The prevalence of LTBI in Iranian HCWs based on occupation and wards

- 241 The prevalence of LTBI in assistant nurses was estimated 45.76% [CI 95%: 33.51-58.55],
- in physicians was evaluated 44.99% [CI95%: 33.37-57.17], in ward nurses was calculated
- 243 39.4% [CI95%: 17.63-66.39], and in service workers was estimated 36.43% [CI95%: 19.51-
- 244 57.53] based on PPD test. The prevalence of LTBI in both nurses and TB service workers
- 245 was higher than other occupations based on QFT (Fig 8).
- Fig 8. The prevalence subgroup analysis of occupational (Forest plot Random effect
 model) based on PPD (A), and QFT (B) in HCWs with LTBI.
- The prevalence of LTBI in the infectious ward was estimated (52.09% [CI95%: 43.92-60.14]), and in the internal ward was evaluated (50% [CI95%: 34.22-65.78]. The lowest
- 250 prevalence of LTBI was estimated in the infectious wards based on QFT. There was a
- 251 significant relationship between the prevalence of LTBI in HCWs, and hospital wards (p
- 252 <0.0001) (Fig 9).
- Fig 9. The prevalence subgroup analysis of ward (Forest plot Random effect model) base
 on PPD (A), and QFT (B) in HCWs with LTBI.
- 255 **3.8.** The prevalence of LTBI in HCWs based on gender and age
- The prevalence of LTBI was estimated at 42.16% [CI95%: 26.41-59.69] in male Iranian
- 257 HCWs based on the PPD test. The prevalence of LTBI in Iranian HCWs and type of gender
- 258 based on PPD test (P <0.051). In QFT, however, a significant relationship was showed
- between the prevalence of LTBI in HCWs, and the gender (P <0.0001) (S5 Fig).
- 260 The prevalence of LTBI in HCWs who were more than 40 years old was estimated 44% [CI]
- 261 **95%: 26.47-63.16] in the PPD test.**

262	The prevalence of LTBI in Iranian HCWs aged 30 years old was estimated 22.52% [CI95
263	%: 3.7-68.34] in the QFT. In both PPD test and QFT, it was evaluated that there was no
264	significant relationship between the prevalence of LTBI in HCWs, and age of HCWs (P
265	<0.0001) (S6 Fig).
266	3.9. The prevalence of LTBI in HCWs based on the history of tuberculosis contact and
267	the tuberculosis clinical symptoms
268	The results showed that 30.15% [CI 95%: 11-60.13] of Iranian HCWs directly contacted
269	to patients with tuberculosis. The results also showed that 6.9% [CI 95%: 2.36-18.55] of
270	Iranian HCWs had active tuberculosis symptoms (S7-8 Fig).
271	3.10. The prevalence of LTBI in HCWs based on the "BCG"
272	The prevalence of LTBI in Iranian HCWs who received the BCG was estimated (15% [CI
273	95%: 3.6-47.73]) based on the PPD test. While the prevalence of LTBI in Iranian HCWs who
274	did not receive the BCG was estimated at 25.71% [CI95%: 13.96-42.49] based on the QFT.

In both PPD, and QFT, there was a significant relationship between those who did and those

who did not receive the vaccine (S9 Fig).

277 **3.11. Publication bias**

The publication bias in this study was evaluated by Begg's and Egger's tests. The publication bias by Begg's test was calculated 0.06, and the Egger's test was calculated 0.028. The probability of the publication bias in this study was significant (S10 Fig).

4. Discussion:

282 This study is the first systematic review and meta-analysis of latent tuberculosis outbreak (LTBI) been carried out in health care workers (HCWs) in Iran. According to results of the 283 284 current meta-analysis, the prevalence of LTBI in HCWs in Iran is estimated at 27.1% [1]. 285 Among the low- and middle-income countries, the prevalence of LTBI in Kenya [63], 286 Zimbabwe [64], Russia [65], Brazil [66], Vietnam [67], Rwanda [68], China [69] and South 287 Africa [70] has been higher than in Iran [1]. The prevalence of LTBI in HCWs Italy [71], Norway [72] and India [73] is reported to be equal to or less than Iran. Iran is a TB endemic 288 289 country [25] and the treatment of latent tuberculosis is usually done by using a single 290 medicine and only in high risk groups [74]. While in high-income countries, screening of 291 pulmonary and lab staffs is recommended annually [75]. Also, based on the prevalence of 292 LTBI in Iranian HCWs, it could be seen that Iranian HCWs training is not sufficient in 293 confronting a patient with tuberculosis [25]. Hence, Iranian HCWs do not fully understand 294 isolation and personal protection [25].

According to the results of meta-analysis, the lowest prevalence of LTBI in HCWs was in southern Iran (18.2%). The highest prevalence of LTBI in HCWs was reported in northern and western Iran. The high prevalence of LTBI in HCWs may be due to neighboring Azerbaijan and Iraq [76].

Azerbaijan which is listed on the high burden countries has high prevalence of multidrug resistance MTB [76-78]. In fact, the northern neighbors of Iran, such as Kazakhstan, Azerbaijan, are among the high burden countries with a high prevalence of multi-drug resistant tuberculosis [80].

303 On the other hands, the name of the country's western neighbor of Iran –Iraq- is not listed on 304 the high burden countries [76-78] but according to reports from Ministry of Health - Iran 305 Center for Medical Education and Treatment, Infectious Disease Control Center- the Iraqi 306 state may have become a high-risk source for tuberculosis after undergoing its recent crisis307 [79, 80].

The current study showed that 15.5% of the HCWs used before the BCG with at least a 308 309 positive PPD test. According to studies, BCG does not protect adults from getting infected 310 with tuberculosis, so the positive results of tuberculin testing in people vaccinated with BCG 311 will be considered as a latent infection [81]. In other words, previous vaccination with BCG prevents tuberculin testing [82]. This may be due to a false positive reaction in PPD [25]. 312 313 Some HCWs may respond to skin tests without being infected with mycobacterium [83]. The 314 reason for these false-positive reactions may be due to contamination with non-tuberculosis 315 mycobacterium, previous BCG, poor test performance or inappropriate interpretation of the 316 test [83].

317 **5. Limitations**

Information about this meta-analysis was extracted from data published in Iranian databases as there was no access to the actual information of the control center of the Ministry of Health and Medical Education, so the exact prevalence of LTBI in HCWs could not be calculated.

Selection bias is able to limit the generalization of these findings because the type of bacteria
strains in a country could be different with the other countries and could be related to descent
diversities.

On the other hands, patients may not respond to skin test tuberculosis, even if they are infected with *Mycobacterium*. It may be due to skin allergies, recent infections (recent contact for 8 to 10 weeks), chronic infection, recent vaccinations with live viruses, advanced tuberculosis, some viral diseases (measles and bile), misdiagnosis skin or incorrect interpretation of the reaction. Patients may also respond to skin tests, even without being infected with *Mycobacterium*. The reason for these reactions may be due to contamination with non-tuberculosis *Mycobacterium*, previous BCG, inappropriate test run or inappropriateinterpretation of the test.

333 Despite the fact that the CDC updates the guidelines for the prevention and transmission 334 of *M. tuberculosis* in health-care settings annually, the protocol for HCWs in Iran has not yet 335 been prepared. Also, workshops could be developed to train tuberculosis prevention and self-336 care HCWs in the western regions of the Iran.

National databases are not sensitive to operators "AND" and "OR" to search for the
combinations. Also, some databases were not fully accessible because of using Guilan
University of Medical Sciences' - Iran Ministry of Health & Medical Education- VPN.

340 **6. Conclusion**

341 This meta-analysis showed the prevalence of LTBI in HCWs in Iran and estimated at 27.1%. The prevalence of LTBI in HCWs of Italy, Norway and India is reported to be equal 342 343 to or less than HCWs of Iran. On the other hand, the highest prevalence of LTBI in HCWs in 344 the north and the west of Iran may due to neighboring with Azerbaijan and Iraq which has 345 become a high-risk source for tuberculosis by overcoming its recent years of crisis. Meanwhile, HCWs training is not sufficient in confronting a patient with tuberculosis, in 346 347 Iran. Hence, Iranian HCWs do not fully understand the isolation and personal protection. We also found that BCG was not able to protect Iranian HCWs from TB infectious, completely. 348
