eFigure 1: Distribution of Genomic *WWTR1-CAMTA1* Fusion Expression

**A,B)** Fusion expression data from 45 subjects with *WWTR1-CAMTA1* fusion data available. *WWTR1-CAMTA1* fusion expression demonstrated a right-skewed, log-normal distribution (**A**) corroborated by the plot between empirical and theoretical cumulative distribution function (CDF; **B**). **C**) In a clinical cohort of 10 subjects with *WWTR1-CAMTA1* fusion data available, subjects with stage III/IV disease demonstrated a non-significant trend towards increased expression of the *WWTR1-CAMTA1* fusion ( $677 \pm 706$  vs  $231 \pm 213$  copies;  $p=0.2$ ).

eFigure 2: Age At Diagnosis

In 45 EHE subjects with data available, mean age at diagnosis was 50.2 years of age with an apparent bimodal distribution around the 45 year mark.

### eMethods: Models

Utilizing the `mclust` package in R v.3.4.3, a Gaussian finite mixture model was fit to the data. A second forced a one-compartment model was then fit to the same data. These two models were then tested by calculating the difference in model fit by a log-likelihood ratio test (Log-likelihood one-component model -207.2 vs two-component model -197.6, difference 9.6, 95%CI 0.0-23.8,  $p=0.02$ ). The 95% confidence interval (95%CI) was generated by bootstrapping the model comparison for 1,000 iterations. Statistical significance here suggests the distribution of the tested data is significantly different than a one-compartment model distribution.
