

**Movie S1 - The binding pocket of GfTNMT.** Residues forming the benzyl pocket (BP) and catalytic pocket (CP) are present at the opening of the binding pocket on alternate sides of the BIA product (*S*)-*cis*-*N*-methylstylopine (SMS). Additional interactions between GfTNMT and SMS occur within the isoquinoline pocket (IP). The overall binding pocket adopts an “L-shape” which is complementary to a conformation that only the (*S*)-*cis* configuration of *N*-methylstylopine can readily adopt. The other product of the reaction, *S*-adenosyl-L-homocysteine (SAH), is found proximal to the CP within the cofactor binding site. GfTNMT is drawn in ribbon representation colored according to a gradient from the N-terminus (blue) to the C-terminus (red), with the gap from residues 68-81 represented as a dashed line. SAH (carbon atoms, magenta), and SMS (carbon atoms, light gray) are shown in all-atom, space-filling representation. Residues comprising the CP, BP, and IP regions are shown in transparent space-filling representation and as sticks

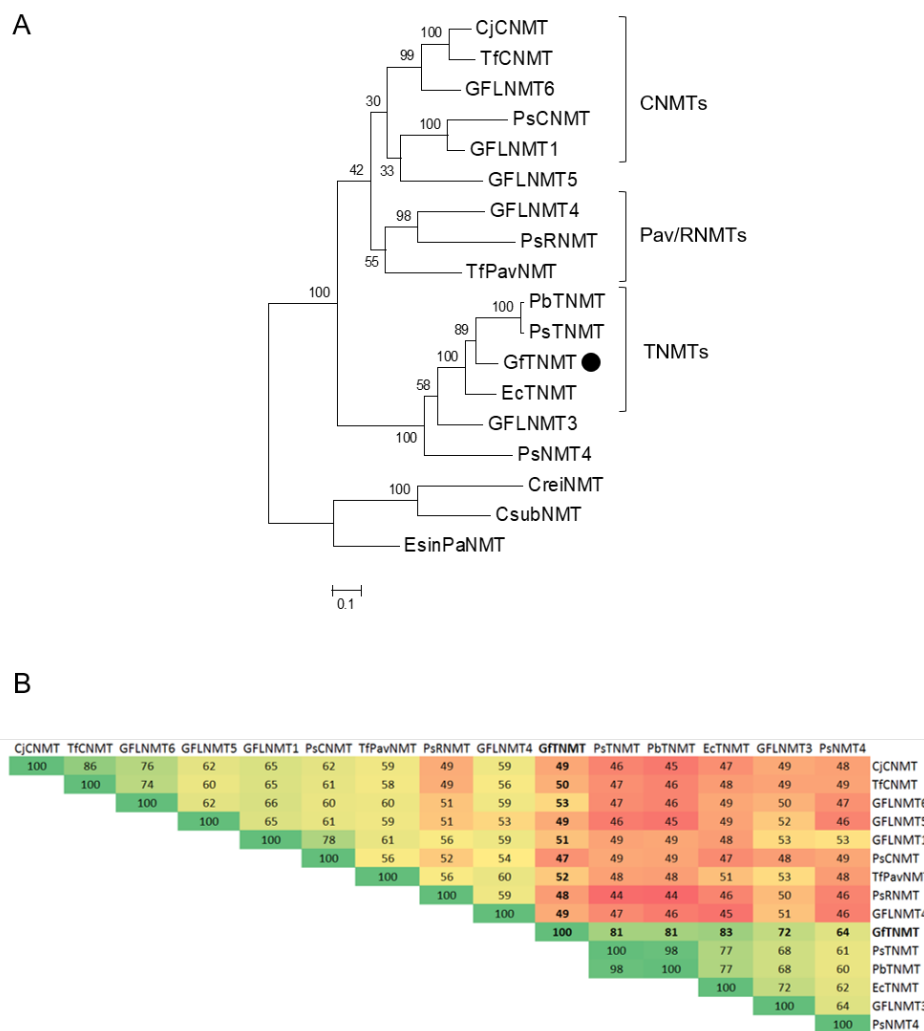

**Table S1 – R group designations for substrates used in this work.** The relative activity of *Gf*TNMT with each substrate is given in Table 1.

Alkaloid subclass		Alkaloid	R group substituents
Tetrahydroisoquinoline		Salsolinol	R <sub>1</sub> = OCH <sub>3</sub> R <sub>2</sub> = OCH <sub>3</sub> R <sub>3</sub> =H
		Heliamine	R <sub>1</sub> = OH R <sub>2</sub> = OH R <sub>3</sub> =CH <sub>3</sub>
1-Benzylisoquinoline		(S)-Coclaurine	R <sub>1</sub> =OCH <sub>3</sub> R <sub>2</sub> =OH R <sub>3</sub> =H R <sub>4</sub> =OH R <sub>5</sub> =H
		(S)- <i>N</i> -methylcoclaurine	R <sub>1</sub> =OCH <sub>3</sub> R <sub>2</sub> =OH R <sub>3</sub> =H R <sub>4</sub> =OH R <sub>5</sub> =CH <sub>3</sub>
		( <i>R,S</i> )-Norlaudanosoline	R <sub>1</sub> =OH R <sub>2</sub> =OH R <sub>3</sub> =OH R <sub>4</sub> =OH R <sub>5</sub> =H
		( <i>R,S</i> )-Norcoclaurine	R <sub>1</sub> =OH R <sub>2</sub> =OH R <sub>3</sub> =H R <sub>4</sub> =OH R <sub>5</sub> =H
		Papaverine	R <sub>1</sub> =OCH <sub>3</sub> R <sub>2</sub> =OCH <sub>3</sub> R <sub>3</sub> =OCH <sub>3</sub> R <sub>4</sub> =OCH <sub>3</sub> R <sub>5</sub> =N/A
		( <i>R</i> )-Reticuline	R <sub>1</sub> =OCH <sub>3</sub> R <sub>2</sub> =OH R <sub>3</sub> =OH R <sub>4</sub> =OCH <sub>3</sub> R <sub>5</sub> =CH <sub>3</sub>

Structure of tetrahydroprotoberberine N-methyltransferase.

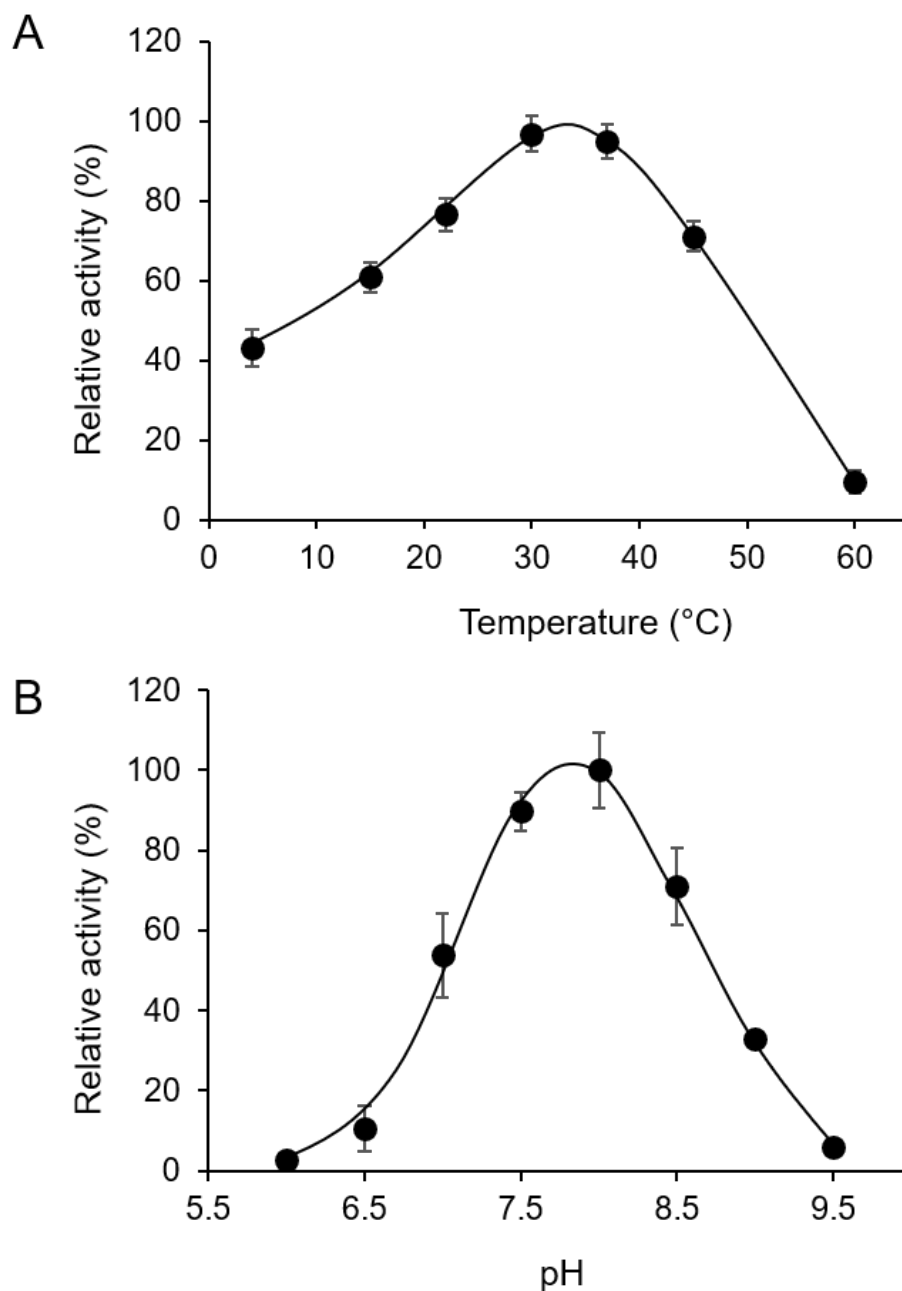

**Figure S1 – Cladogram and amino acid percent identity matrix of cloned BIA NMTs.**

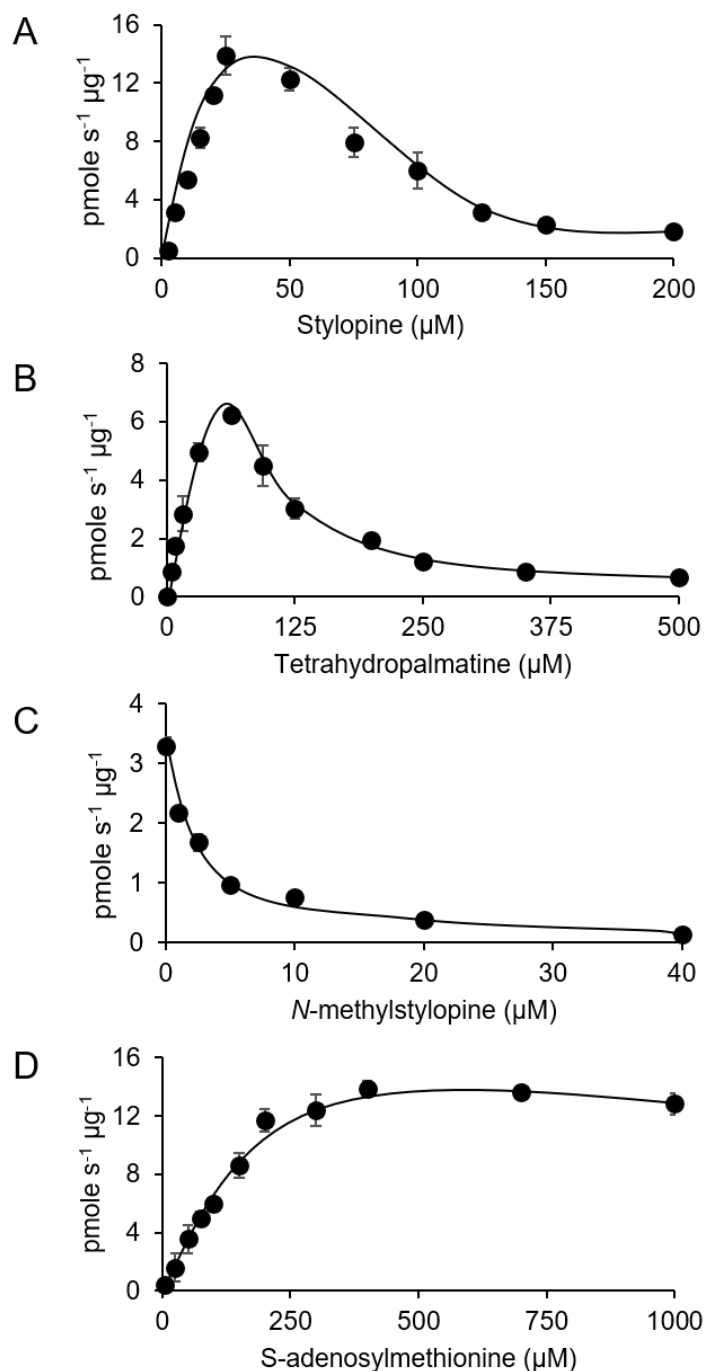

(A) A maximum likelihood phylogenetic analysis was conducted on 18 amino acid sequences aligned by MUSCLE implemented in MEGA7 (1). Positions with less than 50% coverage were eliminated, resulting in a final dataset with 358 positions. Frequencies shown at each node represent the percentage of 500 bootstrapped replicate trees in which the associated taxa clustered together. The tree is drawn with branch lengths proportional to number of substitutions per site. (B) Percentage amino acid identity matrix calculated from alignment of BIA NMTs. Values are color-coded from 100% (green) to 44% (red). Genbank accession numbers or references: *Coptis japonica* coclaurine NMT (CjCNMT; AB061863), *Thalictrum flavum* coclaurine NMT (TfCNMT; AY610508), *Glaucium flavum* NMT 6 (GFLNMT6) (2), *Papaver somniferum* coclaurine NMT (PsCNMT; AY217336), *G. flavum* NMT 1 (GFLNMT1) (2), *G. flavum* NMT 5 (GFLNMT5) (2), *G. flavum* NMT 4 (GFLNMT4) (2), *P. somniferum* reticuline NMT (PsRNMT; KX369612), *T. flavum* pavine NMT (TfPavNMT; EU883010), *Papaver bracteatum* tetrahydroprotoberberine NMT (PbTNMT; EU882994), *P. somniferum* tetrahydroprotoberberine NMT (PsTNMT; Q108P1), *G. flavum* tetrahydroprotoberberine NMT (GfTNMT) (2), *Eschscholzia californica* tetrahydroprotoberberine NMT (EcTNMT; AB232153), *G. flavum* NMT 3 (GFLNMT3) (2), *P. somniferum* NMT 4 (PsNMT4; KX369613), *Chlamydomonas reinhardtii* putative NMT (CreiNMT; XM\_001695135), *Coccomyxa subepsiloidea* putative NMT (CsubNMT; XM\_005645084), *Ephedra sinica* phenylalkylamine NMT (EsPaNMT; MH029305).

**Figure S2 – Collision-induced mass fragmentation analysis of substrates and products in this work.** Spectra for (A) stylophine and putative *N*-methylstylophine, and (B) tetrahydropalmitine and putative *N*-methyltetrahydropalmitine. An increase of 14 *m/z* in the major isoquinoline-derived fragment ion (*m/z* 176+14, 192+14) is consistent with *N*-methylation.

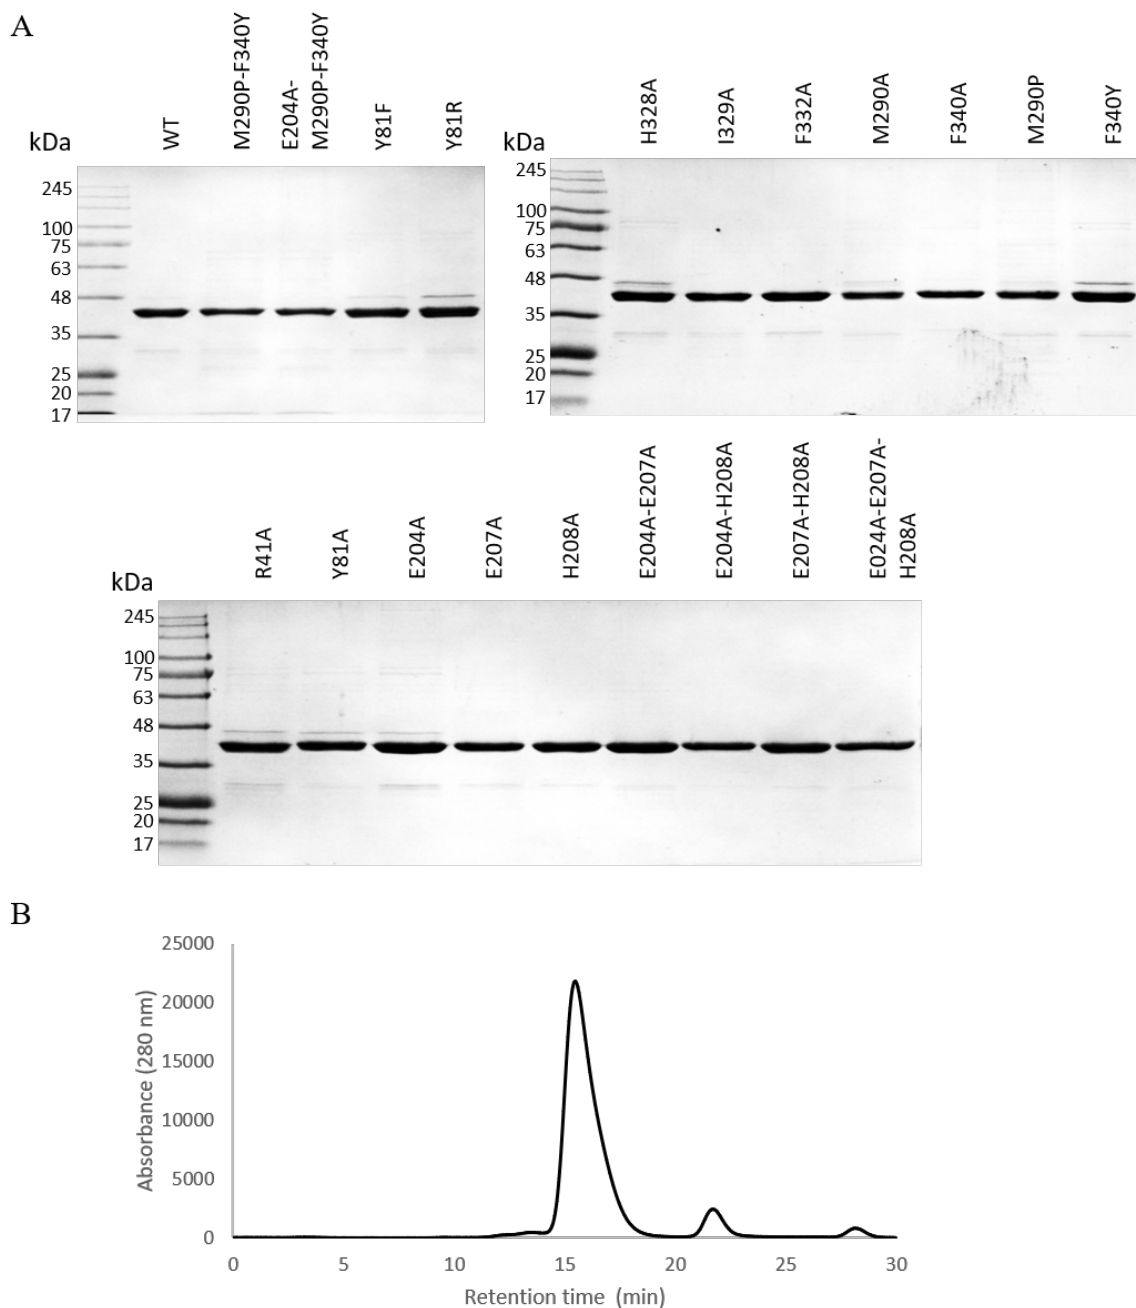

**Figure S3 – Determination of temperature and pH dependence of *GfTNMT* activity *in vitro*.** (A) The effect of temperature was determined by incubating 0.5  $\mu\text{g}$  of purified recombinant *GfTNMT* with 100  $\mu\text{M}$  (*R,S*)-stylopine and 500  $\mu\text{M}$  SAM for 10 minutes in 100 mM Tris HCl pH 8.0 at various temperatures from 4°C to 60°C. (B) The effect of pH was determined under the same conditions, except that the alkaloid substrate was (*S*)-scoulerine, the buffer was 100 mM Bis-Tris propane HCl pH 6.0 - 9.5 and temperature was maintained at 30°C. Assay parameters were previously determined to maintain linearity of product formation. Relative product formation was quantified by LC-MS, with the maximum product ion count set to 100% and all other corresponding values scaled accordingly. Error bars represent standard deviation of three replicates.

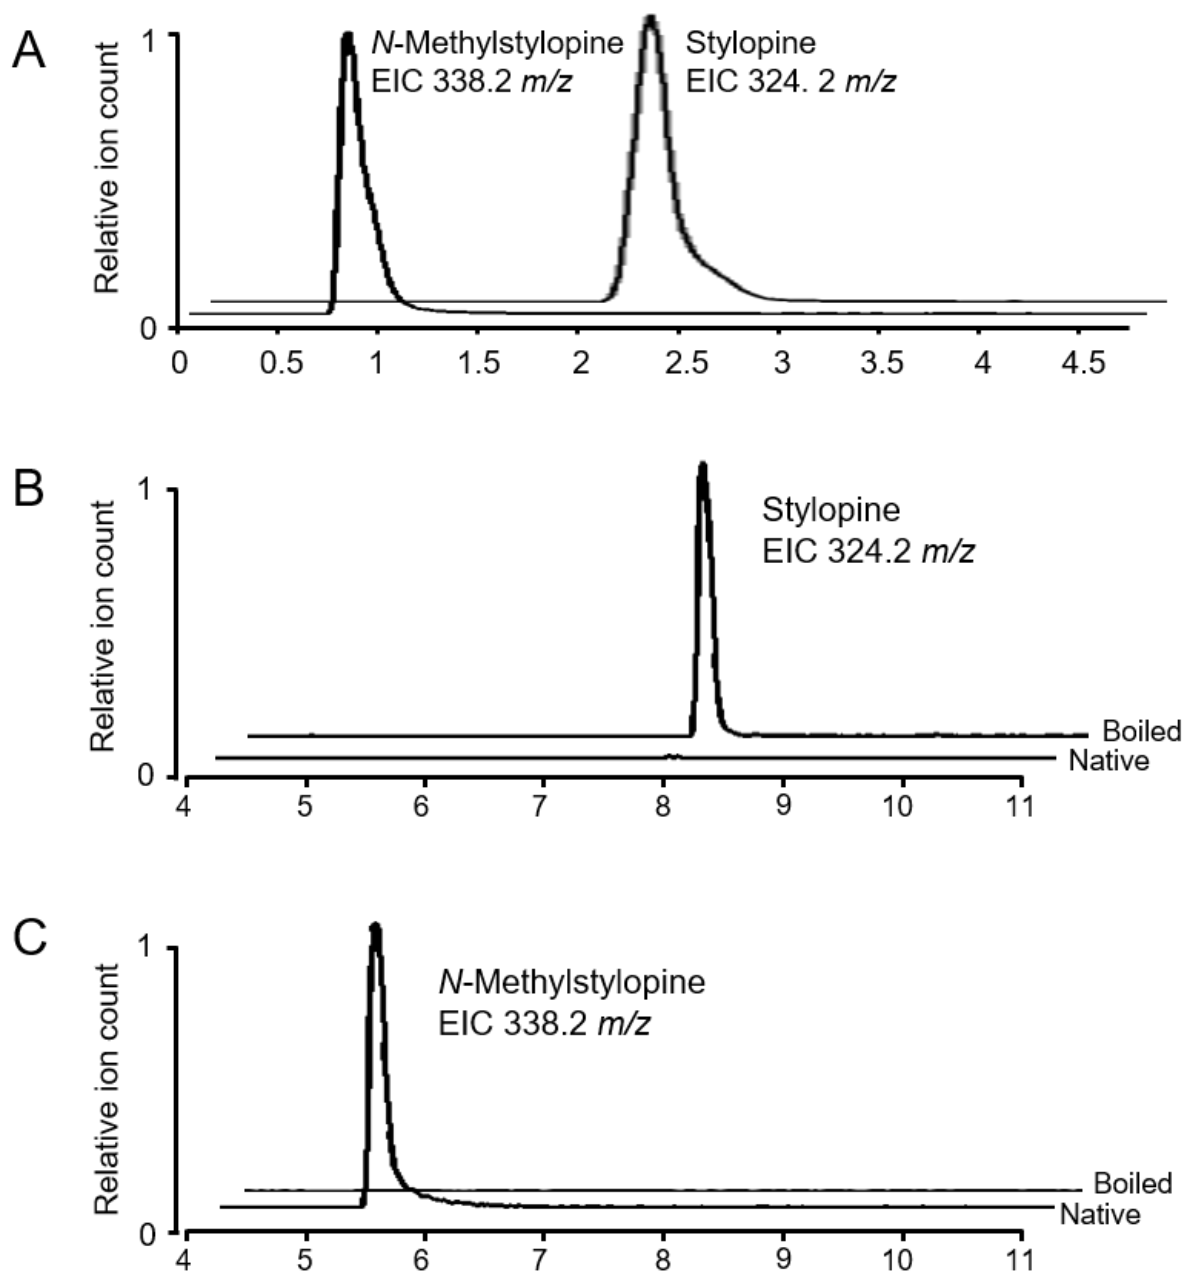

**Figure S4 – Steady state enzyme kinetics and product inhibition for *GfTNMT*.** (A) Steady state reaction velocity of *GfTNMT* versus stylopine concentration. (B) Steady state reaction velocity of *GfTNMT* versus THP concentration. (C) Steady state reaction velocity of *GfTNMT* with 100  $\mu\text{M}$  THP versus *N*-methylstylopine concentration. (D) Steady state reaction velocity of *GfTNMT* versus SAM concentration. Reaction velocities were determined at pH 8.0 and 30°C. Incubation time (10 minutes) and enzyme quantity (0.5  $\mu\text{g}$ ) were optimized to ensure linear product formation conditions. Product formation was quantified by LC-MS with reference to a standard curve. Error bars represent standard deviation of three replicates.

Structure of tetrahydroprotoberberine N-methyltransferase.

**Figure S5 – SDS-PAGE of purified recombinant proteins and presence of *GfTNMT* as a dimer in solution.** (A) The purity of purified recombinant wildtype *GfTNMT* and mutants was determined using 1  $\mu$ g protein in SDS-PAGE. Gels were stained with Coomassie Brilliant Blue R-250. (B) The dimeric state of wild-type *GfTNMT* *in vitro* was determined by gel filtration at a protein concentration 0.2 mg/ml in dialysis buffer B, 20  $\mu$ L of sample was separated on a Superdex 200 column by high pressure liquid chromatography at 0.1 ml/min. The elution profile was compared to commercially obtained molecular weight standards under identical conditions using ovalbumin (43 kDa), carbonic anhydrase (29 kDa), aprotinin (6.5 kDa), and conalbumin (75 kDa).

**Figure S6– Evidence for enantiomeric purity of stylophine used in this work.** (A) Chiral HPLC-MS analysis of stylophine and *Gf*TNMT product *N*-methylstylophine under conditions reported to separate protoberberine enantiomers (3). Extracted ion chromatograms for the *m/z* corresponding to either ionized molecule (M+H) show one single peak. (B, C) Enzyme assays showing complete conversion of stylophine to *N*-methylstylophine by native recombinant purified *Gf*TNMT. All available literature reports indicate that TNMT enzymes do not accept (*R*)-protoberberines as substrates (4).
