

Figure S1. PDGF-BB treatment upregulated CXCR4 and CXCR7 protein expression in pericytes. (A) PDGF-BB treatment (24 h) increased CXCR4 and CXCR7 protein expression. (B) PDGF-BB treatment (10 ng/ml) increased CXCR4 and CXCR7 protein expression. Data are means  $\pm$  SD from three independent experiments. \* $P$ <0.05 vs. 0 ng/ml or 0 h. CXCR, C-X-C motif chemokine receptor; PDGF-BB, platelet-derived growth factor-BB.
