Supplemental Figure 1. Flow cytometry panels. Successive gating strategy used to characterize subpopulations of Fc γ RIIIa-expressing cell subsets using 7 flow cytometry panels. Gating strategies began by first identifying small lymphocytes through forward and side scatter profiles, single cells, and dead cell exclusion using an amine reactive dye. An initial survey identified an expanded Fc γ RIIIa+CD3+CD8+ cell subset within HIV+ donors, with differential PD-1 expression, as represented here (**A**). Five additional flow cytometry panels were designed to further characterize this subset. Homing markers were characterized in CD16 positive *versus* negative CD8 T cells, with CCR5, CXCR3, PD-1 and TRAIL gated individually within each CD16 expression subset (**B**). Additionally, CD16+ CD8 T cells were screened for surface and intracellular NK cell, innate-like markers through individual gating of IL-7R, Perforin, NKP46, and CD161 (**C**), single gating on NKG2D, and all combinations of NKG2A and CD57, individually or together (**D**). CD16+ CD8 T cells were also characterized for their differentiation and maturation markers through single gating on CD27, or all combinations of CD45RA and CCR7 (**E**). Transcription factors T-bet, Eomes, and Helios were characterized alone or in combination within CD16+ CD8 T cells, CD16- CD8 T cells, as well as CD56^{dim} Fc γ RIIIa+ NK cells (**F**). Finally, surface KIR3DL1, KIRDL2/DS2/DL3, and KIR2DL1/S1 expression was measured in Fc γ RIIIa+ CD8 T cells and NK cells. CD8 T cells were gated on as CD3+CD8+ T cells, enriched for late-stage effector phenotype by gating on CD57+CD45+ cells, and further gated as CD16+. NK cells were identified by their CD3 negativity, followed by gating on CD56^{dim}CD16+ cells. All KIR gates were drawn as individual gates (**G**).

Supplemental Figure 2. Hierarchical clustering of gene expression in sorted cell subsets. Two-way hierarchical clustering of gene expression in sorted subsets of CD8 T cells; CD45RA-CD57-, CD45RA+CD57+Fc γ RIIIA-, CD45RA+CD57+Fc γ RIIIA+, as well as CD56dim Fc γ RIIIA+ NK cells. Data is normalized $2^{\Delta Ct}$ values.
