

BMJ Open

BMJ Open is committed to open peer review. As part of this commitment we make the peer review history of every article we publish publicly available.

When an article is published we post the peer reviewers' comments and the authors' responses online. We also post the versions of the paper that were used during peer review. These are the versions that the peer review comments apply to.

The versions of the paper that follow are the versions that were submitted during the peer review process. They are not the versions of record or the final published versions. They should not be cited or distributed as the published version of this manuscript.

BMJ Open is an open access journal and the full, final, typeset and author-corrected version of record of the manuscript is available on our site with no access controls, subscription charges or pay-per-view fees (<http://bmjopen.bmj.com>).

If you have any questions on BMJ Open's open peer review process please email info.bmjopen@bmj.com

ABSTRACT (248 words)

Objectives: To use record linkage of birth cohort and administrative data to study educational outcomes of children who are looked-after (in public care) and in need (social services involvement), and examine the role of early life factors.

Setting, Design: Prospective observational study of children from the Avon Longitudinal Study of Parents and Children (ALSPAC), which recruited pregnant women in and around Bristol, UK in the early 1990s. ALSPAC was linked to the annual Children Looked-After (CLA) Data Return and Children In Need (CIN) Census. Educational outcomes at 16 years were obtained through linkage to the National Pupil Database. These included passing 5+ good GCSEs (grades A*-C, including English and Maths). Covariates included early-life adversity and social position.

Participants: 9545 children from ALSPAC who had complete education and covariate data were included in the main educational outcomes analyses.

Results: Overall, of the 12,868 ALSPAC participants linked to NPD data, 137 had a CLA record and a further 209 a CIN record during adolescence. These children were more disadvantaged than their peers and had little active study participation beyond infancy. In the main educational outcomes analyses, achievement of 5+ good GCSEs was low in the CLA (OR 0.14, 95% CI 0.05-0.35) and CIN (0.11, 0.05-0.27) groups relative to their peers.

Measured early-life factors explained little of this difference.

Conclusions: Data linkage enabled the study of educational outcomes in children with social services contact. These children had substantially worse educational outcomes relative to their peers, for reasons likely to be multifactorial.

Key Words: ALSPAC; record linkage; education; social care; looked-after; adolescence

Article Summary - Strengths and Limitations

- We link a population-based birth cohort study (ALSPAC) to social care and educational records, and demonstrate that record linkage offers a means to identify vulnerable children in a cohort and increase their inclusion in research.
- The children in ALSPAC who had been looked-after (in public care) were broadly representative in terms of their care characteristics of children nationally of the same age who had been looked-after.
- We were only able to identify children who had been in care or in need during adolescence.
- Cohort data availability for children with social care records in adolescence was low beyond infancy.

INTRODUCTION

Children with social services contact, including those in public care, are at higher risk of poor outcomes than their peers, including low educational attainment, substance abuse, and mental illness(1-10). The extent to which this reflects early-life adversity prior to contact with services as opposed to later influences is unclear. Outcomes mainly resulting from early adversity may be less amenable to change through social care interventions, requiring alternative prevention strategies. These children are challenging to study using traditional research methods. A recent Children's Commissioner for England report highlights that vulnerable children are 'absent or poorly measured in national studies'(11), and children's social care is a difficult area in which to conduct randomised controlled trials(12). Further, those who experience extreme adversity are likely under-represented in birth cohort studies due to low recruitment and high attrition, and identification of vulnerable children is challenging due to reliance on parental-report.

Children with social services contact in England do however have high levels of administrative data. The term 'in need' refers to children who have been referred to and assessed by social services and found to be 'unlikely to achieve or maintain a reasonable level of health or development, or whose health and development is likely to be significantly or further impaired, without the provision of services; or a child who is disabled'(13). Almost 390,000 children are currently classified as 'in need'(14). Some children in need may enter the public care system and become a 'looked-after' child. Presently over 72,000 children are looked-after(15), with the majority placed with foster carers(1).

While routine statistics using social care data can highlight poor outcomes, e.g. low average educational attainment, they lack information on early-life and family characteristics(1, 16, 17). These types of data are readily available in birth cohort studies. Linking cohort data to

1
2
3 social care records could therefore provide a means of identifying children in need and
4
5 looked-after without reliance on parental-report. Further, using additional linked data to
6
7 measure outcomes potentially enables the child's inclusion in analyses even if their family
8
9 have stopped actively participating in the cohort study.
10
11

12
13 We use record linkage to a birth cohort to examine the effect of being in need or looked-after
14
15 in adolescence on educational outcomes at age 16 years: the low attainment of many in need
16
17 and looked-after children at this age is a concern as it can compound their disadvantaged
18
19 childhoods to limit future education, employment, and general life chances(18).
20
21

22 23 **METHODS**

24 25 **Data**

26 27 *Avon Longitudinal Study of Parents and Children (ALSPAC)*

28
29 Pregnant women living in and around the city of Bristol, UK with expected date of delivery
30
31 April 1991 to December 1992 were eligible to participate in ALSPAC. There were 14,541
32
33 pregnancies enrolled, resulting in 13,988 children alive at one year, including 13,972
34
35 singletons and twins. This 'core sample' was later bolstered by further eligible children: an
36
37 additional 713 from age 7-18yrs, and to date 183 since age 18yrs. The mothers, their partners,
38
39 and the study children are studied via questionnaires and clinic visits. Teachers also
40
41 completed questionnaires on the children. Further details are provided in cohort profiles(19,
42
43 20) and searchable data-dictionary(21). For the main analyses on educational outcomes, the
44
45 sample was restricted to: core, one child per family, with education data (n=9545, Figure 1).
46
47
48
49
50
51

52
53 Ethical approval for ALSPAC was obtained from the ALSPAC Ethics and Law Committee
54
55 and Local Research Ethics Committees. When study children reached age 18, they were sent
56
57 'fair processing' materials which described ALSPAC's intended use of their health and
58
59
60

1
2
3 administrative records, and gave a clear means to object(22). Education data were not
4
5 extracted for participants who objected, or who were not sent fair processing materials.
6
7

8 *Linkage data*

9

10
11 Data on children who are looked-after, or have been referred as a child in need, are collected
12
13 annually via the Children Looked-After (CLA) Data Return(23) and the Children in Need
14
15 (CIN) Census(24). The CIN Census covers all children referred to children's social services
16
17 even if no further action is taken. The CLA Return and the CIN Census have been linked to
18
19 the National Pupil Database (NPD), a repository of education data for schools in England(25),
20
21 since their 2005/06 and 2008/09 data collections respectively. ALSPAC has an established
22
23 link to the NPD, and thus to any post-2005 CLA or post-2008 CIN record for participants in
24
25 the NPD. Earlier CLA records were also obtained for those with a post-2005 record.
26
27 However, CLA data collection was only on a random one-third sample of looked-after
28
29 children from 1998-2003, meaning no records exist for many looked-after children in this
30
31 period(23). Insufficient identifiers exist within the CLA dataset to enable linkage of
32
33 ALSPAC to pre-2005 CLA records for those without a post-2005 record.
34
35
36
37
38

39 We also obtained CLA records for all individuals in the CLA Return of a similar age (born
40
41 January 2001-December 2002) to form two comparison groups: (1) ever looked-after in
42
43 England (n=43,938); (2) ever looked-after in the four local authorities that approximate the
44
45 ALSPAC recruitment area (Bristol City; South Gloucestershire; North Somerset; Bath and
46
47 North East Somerset) (n=713).
48
49
50

51 **Measures**

52 *Educational outcomes*

53
54

55
56 Pupils in England study General Certificate of Education (GCSE) courses during Key Stage 4
57
58 (KS4) of their education (Years 10 and 11, aged 14-16yrs) and take GCSE exams at the end
59
60

1
2
3 of Year 11. The oldest ALSPAC children sat their GCSE exams in 2007, the youngest in
4
5 2009. Our main outcomes were two measures of attainment. First, a binary measure:
6
7 achievement of 5+ good GCSEs (grades A*-C, including English and Maths). Second, a
8
9 continuous measure: capped point score, expressed as a percentage of the maximum possible
10
11 capped point score (based on the eight best grades obtained, with each grade assigned a
12
13 numerical value)(26). Secondary educational outcomes included: persistent absence ($\geq 10\%$
14
15 of half days); special educational needs (SEN) status (see footnote of Table 2); and school
16
17 mobility (whether child joined school during KS4).
18
19
20
21

22 *Contact with children's social care services*

23
24
25 Contact with children's social care services (referred to as 'social care status' hereafter) was
26
27 summarised in two variables. The first specified whether a child had any post-2005 CLA
28
29 record(s) or post-2008 CIN record(s) (i.e. was looked-after or referred to social care services
30
31 at any time for which we have linked social care data). The second summarised social care
32
33 status during KS4 only. This restriction was necessary for the educational outcomes analyses
34
35 to ensure our exposure preceded our outcome, plus these are the only two school years with
36
37 CLA data coverage for all children in our sample (Supplementary Table A). By definition
38
39 children who are looked-after are also in need but we use 'in need' to refer to children with a
40
41 CIN but not a CLA record. The reference group comprised children with a KS4 record in the
42
43 NPD who had no linked social care record.
44
45
46
47
48

49 Variables related to being in care or in need were derived from the linked data as follows.

50
51 CIN Census: category of need; age referred. CLA Return: category of need; age first period of
52
53 care (POC) started (POC is a period of time when child is continuously looked-after by the
54
55 local authority); number of POC and episodes of care (a POC is comprised of 'episodes', each
56
57 representing a period of being looked-after under the same legal status and in the same
58
59
60

1
2
3 placement); placement type (foster; children's home/residential home/residential school; other
4
5 [no further disaggregation possible due to small numbers]).
6
7

8 *Covariates*

10
11 These included child age and sex, plus measures related to family socio-economic position
12
13 (SEP). Early-life exposures were reported by the mother during pregnancy: age at delivery;
14
15 highest educational qualification; financial difficulties; housing tenure; partner status;
16
17 smoking; social support; depressive symptoms(27). Later measures of SEP (during KS4)
18
19 were obtained from the NPD: receipt of free school meals (FSM)(28); and child's residential
20
21 neighbourhood deprivation measured by the Income Deprivation Affecting Children Index
22
23 (IDACI)(29). More details in Supplementary Text.
24
25
26
27

28 **Statistical analyses**

29
30
31 Descriptive statistics were used to: summarise the social care data linked to ALSPAC
32
33 children; compare the ALSPAC looked-after sample to the two non-ALSPAC looked-after
34
35 comparison groups; compare child, maternal and SEP characteristics by social care status;
36
37 describe questionnaire completion rates by social care status.
38
39
40

41 Associations between social care status and educational outcomes were examined using
42
43 multilevel regression models (individual level 1, school level 2). Linear models were used for
44
45 capped point score, logistic for attainment of 5+ good GCSEs. Models adjusted for age and
46
47 sex (Model 1), then also for KS4 measures [FSM, neighbourhood deprivation, school
48
49 mobility] (Model 2), or for early-life exposures (Model 3). We then adjusted for all KS4 and
50
51 early-life variables (Model 4). Multiple imputation using chained equations was used to
52
53 impute missing data (supplementary Table B) for the educational outcomes analyses sample
54
55 (n=9545). 100 datasets were imputed.
56
57
58
59
60

1
2
3 In sensitivity analyses, models were restricted to children with no SEN (n=8145) or no
4 disability (n=9506). Social care status at any time was also considered. Finally, we described
5 associations between social care characteristics (e.g. placement type, reason for being in need)
6 and capped point score in those with CIN or CLA records: to maximise sample size, we
7 included all those who had these records at any time and who had capped point score data.
8
9
10
11
12
13
14

15 **Patient and Public Involvement**

16
17 Patients, the public, and study participants were not directly involved in this study. Some
18 ALSPAC participants are members of a committee which meets bi-monthly to provide
19 insights and advice on general ALSPAC study design, methodology and acceptability for
20 participants.
21
22
23
24
25
26
27
28
29
30

31 **RESULTS**

32 **Children in ALSPAC with social care records**

33
34 Of those with a post-2008 CIN (but no CLA) record (n=209) the most common needs at
35 referral were child disability, abuse or neglect, and family in acute stress. Of those with a
36 post-2005 CLA record (n=137), the most common primary need was abuse or neglect
37 (Supplementary Tables C and D). Median total time in care was 2.6 years. Foster care was
38 the most common placement type.
39
40
41
42
43
44
45
46
47
48

49 **Comparison to non-ALSPAC looked-after children**

50
51 The ALSPAC children with CLA records were generally similar to those of children born at
52 the same time who were ever in care in England (comparison group 1) or in the area in and
53 around Bristol (comparison group 2) in terms of primary need (Supplementary Table E).
54
55
56
57
58
59 Importantly, many of those who had ever had a CLA record in the two comparison groups
60

1
2
3 (36% of group 1; 42% of group 2) had left care before the age of 12 (the youngest age at
4
5 which we were able to link CLA records to ALSPAC).
6
7

8 **Availability of cohort data**

9

10
11 Maternal questionnaire response rates were highest for participants with no social care record
12
13 and lowest for those with a CLA record at all time points. Differences generally widened
14
15 over time (Figure 2). Patterns were similar for partner and child, but not teacher,
16
17 questionnaires (supplementary Figures 3a-d).
18
19

20 **Educational outcomes at 16 years**

21

22
23 Of the 9545 children in these analyses, 49 had CLA and 64 CIN (no CLA) records during
24
25 KS4. These groups were more disadvantaged than their peers in early-life and during KS4
26
27 (Table 1). They were more likely to have joined their school recently.
28
29

30
31 Of those with CIN or CLA records, <15% passed 5+ good GCSEs compared to >50% of their
32
33 peers. Mean percentage scores were also markedly lower (Table 2). They were more likely
34
35 to have SEN and persistent absence rates were higher, particularly for the in need group.
36
37

38
39 Adjustment for school absence, neighbourhood deprivation, and receipt of FSM attenuated
40
41 associations slightly for the CIN group but had less of an impact for the CLA group (Table 3).
42

43
44 Adjustment for early-life maternal and SEP factors had more of an attenuating effect for the
45
46 CLA than the CIN group. Attainment differences between these groups and their peers
47
48 remained in the fully adjusted model.
49

50
51 In sensitivity analyses, when social care records at any time were considered, patterns were
52
53 similar for the CLA group (n=76), while the CIN group (n=148) tended to do better than
54
55 when restricted to only those who were in need during KS4 (Table 2). When the sample
56
57 excluded those with SEN or disability, results were similar to those of the main analyses
58
59 (supplementary tables F and G).
60

1
2
3 Estimates of the relationship between social care characteristics and attainment were
4
5 imprecise due to small numbers. Those in foster placements had higher capped percentage
6
7 scores (mean 35.9, 95% CI 29.3 to 42.5, n=60) than those in children's/residential
8
9 homes/residential schools (25.0, 12.3 to 37.8, n=12). With regards need status, for both the
10
11 CLA and CIN groups, 'child disability' was associated with the lowest attainment, and
12
13 'parental illness/disability' the highest but confidence intervals were wide and overlapping.

¹ School Action (SA) is used when there is evidence that a child is not making progress at school and there is a need for action to be taken to meet learning difficulties. This can include involvement of extra teachers, use of different learning materials, special equipment or a different teaching strategy.

² School Action Plus (SA+) used where SA has not been able to help the child make adequate progress. The school has sought external services from the local education authority (LEA), the local health authority, or social services to help the child make adequate progress (e.g. speech and language therapist, educational psychologist etc.).

³ If the additional help provided by SA+ is not enough then the child's school or parents can apply to the LEA for a Statutory Assessment of the child's SEN in order to try and obtain a Statement of SEN. The 'statement' is a document which sets out a child's SEN and any additional help that the child should receive. A Statement is normally made when all the educational provision required to meet a child's needs cannot reasonably be met by the resources within a child's school at SA+.

	CLA	-28.4 (-33.5 to -23.2)	-25.0 (-29.7 to -20.3)	-21.8 (-26.5 to -17.1)	-20.4 (-24.9 to -16.0)

¹Adjusted for child age and sex

²Adjusted for child age and sex, plus KS4 time-point variables (persistent school absence, in receipt of free school meals, school mobility, IDACI of residential neighbourhood)

³Adjusted for child age and sex, plus early-life [maternal and SEP] variables (maternal age at delivery, education, partner status, housing tenure, financial difficulties, smoking, depression, social support)

⁴Adjusted for child age and sex, plus KS4 and early life variables

DISCUSSION

Children who were looked-after or in need during KS4 had low attainment at age 16.

Measured early-life exposures were not a major explanatory factor. We believe this is the first time linkage to the CLA Return and CIN Census has been used to identify birth cohort participants who were looked-after or in need during adolescence. As linkage data were also used for outcome measures, participants could be included even if their families no longer actively participated in the cohort study. Record linkage therefore allowed vulnerable children to not only be included in research but to be the focus of it. However, the identification and inclusion of in need and looked-after children in research using record linkage does have challenges.

For cohort studies in England with relevant permissions, linkage to the CLA Return and CIN Census via the NPD offers a convenient means of identifying participants who have been in need or looked-after. For cohorts younger than ALSPAC, this method would allow identification of social care records that cover most, if not all, of participants' childhoods. However, in ALSPAC we were only able to link to records covering a period during adolescence. Consequently, outcomes at younger ages cannot be examined by social care status in ALSPAC using this method. Of the looked-after children in England the same age as the ALSPAC participants, we found around 40% had left the care system by the age of 12. Consequently, our reference group likely includes children who were looked-after or in need at younger ages only.

Examination of questionnaire response rates showed the value of using linked outcome data to increase the inclusion of vulnerable children in research: there was little questionnaire data available beyond infancy for participants with social care records in adolescence. In this current study, we examined educational outcomes at age 16, obtained from the NPD. The

1
2
3 association between social care status and other later outcomes available from linked data
4
5 could also be investigated using ALSPAC, such as mental illness or entry into higher
6
7 education.
8
9

10
11 ALSPAC participants with CLA and CIN records in adolescence had lower educational
12
13 attainment than their peers in the reference group. In the most recent national data available,
14
15 attainment patterns by social care status broadly reflect these findings(1). We found
16
17 persistent absence rates to be considerably lower for those looked-after than those in need
18
19 during KS4. Similarly, in the national data (on pupils of all ages) 9% of looked-after children
20
21 were persistent absentees and 28% of children in need(1). Therefore, although our
22
23 participants were in KS4 around 10 years ago and the number with social care records small,
24
25 the patterning of educational characteristics by care status is broadly similar to the present-
26
27 day situation.
28
29

30
31
32 Using both ALSPAC questionnaire data and measures from the NPD, we found a persistence
33
34 of disadvantage from early-life to adolescence for participants with CIN and CLA records.
35
36 Social disadvantage is known to be strongly associated with poorer educational
37
38 attainment(30, 31), and our SEP measures were strongly related to the educational outcomes.
39
40 Adjustment for them attenuated associations slightly but the low attainment of the CLA and
41
42 CIN groups remained. We are not considering the SEP measures as confounders but rather
43
44 part of the complex causal pathway from early-life adversity through to poor educational
45
46 attainment. Little of the poor educational outcomes in the looked-after and in need groups
47
48 appeared to be explained by the early-life exposures we considered, suggesting there is scope
49
50 for later experiences, including social care, to improve outcomes.
51
52
53

54
55
56 While aspects of care itself could be important contributors to educational outcomes,
57
58 ascertaining direction of causality in the relationship between child behaviours, care
59
60

1
2
3 characteristics, and educational outcomes is difficult. As expected, we found children in
4 foster care had higher attainment than those not in family-based care: the latter children are
5 likely to be those whose foster placements have broken down, reflecting complex additional
6 needs and challenging behaviours. Further, foster carers may have greater commitment and
7 longer-term interest in the child than group care staff(32). We were unable to consider
8 placement stability, which has previously been shown to be beneficial(33). However, in
9 concordance with previous studies, school mobility was associated with lower attainment(34,
10 35) and children with CLA or CIN records were much more likely to have changed school
11 during KS4 than their peers.

The relatively high proportion of looked-after and in need children with SEN or disability did not appear to explain the low average attainment of these groups. Similarly, in the national data looked-after children with no identified SEN made less educational progress than non-looked-after children(1). It is important to note that the attainment gap between looked-after and in need children and their peers is apparent from a young age, often before the child enters care(1, 33). Being looked-after may not be the principal cause of poor attainment, rather it is a marker of extreme childhood adversity, which is itself associated with poor outcomes. Being in care is often beneficial for a child's education(17, 18, 33).

Strengths of this study include the use of a novel method to identify vulnerable adolescents in a population-based cohort, and objective outcome measures. Limitations include incomplete ascertainment of social care record status, little cohort data beyond early childhood for those with social care records, and small numbers. Children who experience the most disadvantaged starts in life are likely under-represented in ALSPAC as their mothers would have been least likely to attend antenatal appointments, which is where many mothers were recruited to the study.

Conclusions

Data linkage provides a means of identifying children with social services contact in cohort studies and of increasing their inclusion in research. The poor educational outcomes of the ALSPAC adolescents with social care records did not appear to be substantially explained by early-life exposures prior to contact with children's social care services, suggesting there may be scope for later interventions to make a difference.

Acknowledgments

We are extremely grateful to all the families who took part in this study, the midwives for their help in recruiting them, and the whole ALSPAC team, which includes interviewers, computer and laboratory technicians, clerical workers, research scientists, volunteers, managers, receptionists and nurses.

Conflicts of interest

JM is a foster carer. AT, AB and DW have no conflicts of interest to declare.

Funding

Core support for ALSPAC is provided by the UK Medical Research Council and Wellcome (Grant reference: 102215/2/13/2) and the University of Bristol. The Wellcome Trust (WT086118) funded ALSPACs linkage infrastructure through the Project to Enhance ALSPAC through Record Linkage (PEARL). This work was supported by the Elizabeth Blackwell Institute for Health Research, University of Bristol and the Wellcome Trust Institutional Strategic Support Fund (Grant number: 105612/Z/14/Z).

Contributor Statement

JM and AB conceived the study, and AT and JM developed the research question. AT conducted the analyses, interpreted the data and drafted the manuscript. JM and DW helped interpret the data and critically revised the paper. AB critically revised the paper. All authors have read and approved this final version.

Data Sharing Statement

The ALSPAC data management plan (available here:

Notes on figure:
 Sample restricted to mothers in the core sample, whose child has been linked to the National Pupil Database.
 Mothers may not have completed every question within each questionnaire.

Figure 2 - Maternal questionnaire response rates by child social care status
 231x223mm (150 x 150 DPI)

Supplementary Text - Additional detail on covariates

- **Early-life, maternal and family characteristics**

The following maternal, family and socioeconomic measures were reported by the mothers during their pregnancy with the study child via postal questionnaires. The categories for each variable are given in parenthesis following the variable name.

Highest educational qualification (university degree/A level; O level; vocational/none)

Financial Difficulties (quartiles of score with range 0–40, where 0 is no financial difficulties)

Housing tenure (owned/mortgaged; private rent; council rent; other)

Partner status (husband; live with partner; do not live with partner/no partner)

Smoking during pregnancy (no; yes)

Low social support - measured by response to 10 items with a low score defined as being in the bottom 10% (no; yes).

Maternal depression - measured by the Edinburgh Postnatal Depression Scale. Although this measure was originally designed for use with postnatal women, none of the 10 items is specific to this period and it has been validated for use at other times; it was chosen as it does not contain somatic items that could confound normal symptoms in pregnancy with depression (27). Quartiles were derived.

- **Proxy measures of socio-economic position when child aged 16**

The following measures were obtained from the National Pupil Database.

1
2
3 **Child in receipt of free school meals (FSM)** - eligibility is based on low parental income

4
5 (28) (no; yes)

6
7
8 **Child's residential neighbourhood deprivation** - measured by the Income Deprivation

9
10 Affecting Children Index (IDACI) (29), which gives the proportion of children (<0-15yrs) in

11
12 a neighbourhood (lower super output area, average population 1500) who live in a low

13
14 income family (<10%; 10 to <20%; 20 to <30%; 40%+).

Supplementary (online only) Tables

Table A: Summary of CLA and CIN data availability by year and period of birth

Table B: Summary of early-life (maternal and family) variables before and after multiple imputation

Table C: Summary of CIN data for ALSPAC participants linked to a post-2008 CLA record

Table D: Summary of care data for ALSPAC participants linked to a post-2005 CLA record

Table E: Comparison of care characteristics between ALSPAC CLA participants and CLA individuals in general population (in ALSPAC area and in England) of same age.

Table F: Educational attainment, absence, and special educational needs by care status – no SEN

Table G: Educational attainment, absence, and special educational needs by care status – no disability

Table A: Summary of CLA and CIN data availability by year and period of birth

Period of birth	Expected school year in March of each year ¹					
	2006 ²	2007 ²	2008 ²	2009 ^{2,3}	2010 ^{2,3}	2011 ^{2,3}
April 1991 to August 1991	Year 10	Year 11⁴	Year 12	Year 13		
September 1991 to August 1992	Year 9	Year 10	Year 11⁴	Year 12	Year 13	
September 1992 to January 1993	Year 8	Year 9	Year 10	Year 11⁴	Year 12	Year 13

¹ The school year in England runs from September to July. In contrast, the CLA and CIN data collection year runs from April to March. For example, the 2006 CLA dataset would cover the period from April 2005 to March 2006; the oldest ALSPAC participants would have been in Year 10 in March 2006, and the youngest in Year 8.

² CLA data linked to NPD available

³ CIN data linked to NPD available

⁴ GCSE exams are taken in May/June of Year 11.

Determining who had CIN record during KS4:

For the CIN data, the youngest cohort participants were in Year 11 at the time of the earliest CIN data collection and they were coded as being 'in need during KS4' if they had a CIN record. However, the majority of the cohort were already in Year 12 or 13 at this time, and so we calculated the age they had been referred, and identified those who had been referred before they sat their KS4 exams (age on the 1st June of the year they were in Year 11 was used as a proxy for age that exams were taken).

Table B: Summary of early-life (maternal and family) variables before and after multiple imputation

Variables with missing data in study sample ¹	% missing	Categories ²	Study sample [N=9545]	
			Before imputation [N specified for each variable individually]	Imputed [N=9545]
Variables reported by mother during pregnancy				
Relationship status	5.2		N=9048	
		Married (%)	75.7 (74.8-76.6)	74.7 (73.8-75.6)
		Resident partner (%)	16.1 (15.3-16.8)	16.5 (15.8-17.3)
		Non-resident/no partner (%)	8.2 (7.7-8.8)	8.7 (8.1-9.3)
Highest maternal education	9.7		N=8623	
		A Level or degree (%)	31.7 (30.8-32.7)	30.5 (29.5-31.4)
		O Level	36.8 (35.8-37.9)	36.5 (35.5-37.5)
		Vocational/none (%)	31.4 (30.4-32.4)	33.0 (32.0-34.0)
Financial difficulties	12.1		N=8387	
		Q1 (none) (%)	34.9 (33.9-35.9)	32.7 (32.7-34.7)
		Q4 (high) (%)	20.4 (19.5-21.3)	21.5 (20.6-22.4)
Housing tenure	5.7		N=9003	
		Owned/mortgaged (%)	74.6 (73.6-75.4)	73.4 (72.5-74.3)
Maternal smoking	5.0		N=9068	
		Yes (%)	26.2 (25.3-27.1)	26.9 (26.0-27.8)
	13.1		N=8294	
Depression score		Highest quartile (%)	22.7 (21.8-23.6)	23.5 (22.6-24.4)
Low social support	16.8		N=7942	
		Yes (%)	9.3 (8.7-10.0)	10.5 (9.7-11.2)
Educational attainment from NPD				
Capped percentage point score ³	0.9	Mean	68.8 (68.4-69.2)	68.5 (68.1-68.9)

¹ The following variables had no missing data in study sample: child age, sex, maternal age at delivery, attainment of 5+ good GCSEs, persistent absence, SEN status, school attended.

² For brevity, not all categories are presented for each variable.

³ The binary attainment variable (5+ good GCSEs) was complete for all those with a KS4 NPD record, but a small number (n=82) had missing capped point score data.

ABSTRACT (248 words)

Objectives: To use record linkage of birth cohort and administrative data to study educational outcomes of children who are looked-after (in public care) and in need (social services involvement), and examine the role of early life factors.

Setting, Design: Prospective observational study of children from the Avon Longitudinal Study of Parents and Children (ALSPAC), which recruited pregnant women in and around Bristol, UK in the early 1990s. ALSPAC was linked to the annual Children Looked-After (CLA) Data Return and Children In Need (CIN) Census. Educational outcomes at 16 years were obtained through linkage to the National Pupil Database. These included passing 5+ good GCSEs (grades A*-C, including English and Maths). Covariates included early-life adversity and social position.

Participants: 9545 children from ALSPAC who had complete education and covariate data were included in the main educational outcomes analyses.

Results: Overall, of the 12,868 ALSPAC participants linked to NPD data, 137 had a CLA record and a further 209 a CIN record during adolescence. These children were more disadvantaged than their peers and had little active study participation beyond infancy. In the main educational outcomes analyses, achievement of 5+ good GCSEs was low in the CLA (OR 0.14, 95% CI 0.05-0.35) and CIN (0.11, 0.05-0.27) groups relative to their peers. Measured early-life factors explained little of this difference.

Conclusions: Data linkage enabled the study of educational outcomes in children with social services contact. These children had substantially worse educational outcomes relative to their peers, for reasons likely to be multifactorial.

Key Words: ALSPAC; record linkage; education; social care; looked-after; adolescence

Article Summary - Strengths and Limitations

- We link a population-based birth cohort study (ALSPAC) to social care and educational records, and demonstrate that record linkage offers a means to identify vulnerable children in a cohort and increase their inclusion in research.
- The children in ALSPAC who had been looked-after (in public care) were broadly representative in terms of their care characteristics of children nationally of the same age who had been looked-after.
- We were only able to identify children who had been in care or in need during adolescence.
- Cohort data availability for children with social care records in adolescence was low beyond infancy.

INTRODUCTION

Children with social services contact, including those in public care, are at higher risk of poor outcomes than their peers, including low educational attainment, substance abuse, and mental illness(1-10). The extent to which this reflects early-life adversity prior to contact with services as opposed to later influences is unclear. Outcomes mainly resulting from early adversity may be less amenable to change through social care interventions, requiring alternative prevention strategies. These children are challenging to study using traditional research methods. A recent Children's Commissioner for England report highlights that vulnerable children are 'absent or poorly measured in national studies'(11), and children's social care is a difficult area in which to conduct randomised controlled trials(12). Further, those who experience extreme adversity are likely under-represented in birth cohort studies due to low recruitment and high attrition, and identification of vulnerable children is challenging due to reliance on parental-report.

Children with social services contact in England do however have high levels of administrative data. The term 'in need' refers to children who have been referred to and assessed by social services and found to be 'unlikely to achieve or maintain a reasonable level of health or development, or whose health and development is likely to be significantly or further impaired, without the provision of services; or a child who is disabled'(13). Almost 390,000 children are currently classified as 'in need'(14). Some children in need may enter the public care system and become a 'looked-after' child. Presently over 72,000 children are looked-after(15), with the majority placed with foster carers(1).

While routine statistics using social care data can highlight poor outcomes, e.g. low average educational attainment, they lack information on early-life and family characteristics(1, 16, 17). These types of data are readily available in birth cohort studies. Linking cohort data to

1
2
3 social care records could therefore provide a means of identifying children in need and
4
5 looked-after without reliance on parental-report. Further, using additional linked data to
6
7 measure outcomes potentially enables the child's inclusion in analyses even if their family
8
9 have stopped actively participating in the cohort study.
10
11

12
13 We use record linkage to a birth cohort to examine the effect of being in need or looked-after
14
15 in adolescence on educational outcomes at age 16 years: the low attainment of many in need
16
17 and looked-after children at this age is a concern as it can compound their disadvantaged
18
19 childhoods to limit future education, employment, and general life chances(18).
20
21

22 23 **METHODS**

24 25 **Data**

26 27 *Avon Longitudinal Study of Parents and Children (ALSPAC)*

28
29 Pregnant women living in and around the city of Bristol, UK with expected date of delivery
30
31 April 1991 to December 1992 were eligible to participate in ALSPAC. There were 14,541
32
33 pregnancies enrolled, resulting in 13,988 children alive at one year, including 13,972
34
35 singletons and twins. This 'core sample' was later bolstered by further eligible children: an
36
37 additional 713 from age 7-18yrs, and to date 183 since age 18yrs. The mothers, their partners,
38
39 and the study children are studied via questionnaires and clinic visits. Teachers also
40
41 completed questionnaires on the children. Further details are provided in cohort profiles(19,
42
43 20) and searchable data-dictionary(21). For the main analyses on educational outcomes, the
44
45 sample was restricted to: core, one child per family, with education data (n=9545, Figure 1).
46
47
48
49
50
51

52
53 Ethical approval for ALSPAC was obtained from the ALSPAC Ethics and Law Committee
54
55 and Local Research Ethics Committees (www.bristol.ac.uk/alspac/researchers/research-ethics/). When study children reached age 18, they were sent 'fair processing' materials
56
57
58
59
60

1
2
3 which described ALSPAC's intended use of their health and administrative records, and gave
4 a clear means to object(22). Education data were not extracted for participants who objected,
5
6 or who were not sent fair processing materials.
7
8
9

10 *Linkage data*

11
12
13 Data on children who are looked-after, or have been referred as a child in need, are collected
14 annually via the Children Looked-After (CLA) Data Return(23) and the Children in Need
15 (CIN) Census(24). The CIN Census covers all children referred to children's social services
16 even if no further action is taken. The CLA Return and the CIN Census have been linked to
17 the National Pupil Database (NPD), a repository of education data for schools in England(25),
18 since their 2005/06 and 2008/09 data collections respectively. ALSPAC has an established
19 link to the NPD, and thus to any post-2005 CLA or post-2008 CIN record for participants in
20 the NPD. Earlier CLA records were also obtained for those with a post-2005 record.
21
22 However, CLA data collection was only on a random one-third sample of looked-after
23 children from 1998-2003, meaning no records exist for many looked-after children in this
24 period(23). Insufficient identifiers exist within the CLA dataset to enable linkage of
25 ALSPAC to pre-2005 CLA records for those without a post-2005 record.
26
27
28
29
30
31
32
33
34
35
36
37
38
39
40
41

42 We also obtained CLA records for all individuals in the CLA Return of a similar age (born
43 January 1991-December 1992) to form two comparison groups: (1) ever looked-after in
44 England (n=43,938); (2) ever looked-after in the four local authorities that approximate the
45 ALSPAC recruitment area (Bristol City; South Gloucestershire; North Somerset; Bath and
46 North East Somerset) (n=713).
47
48
49
50
51
52
53

54 **Measures**

55 *Educational outcomes*

56
57
58
59
60

1
2
3 Pupils in England study General Certificate of Education (GCSE) courses during Key Stage 4
4 (KS4) of their education (Years 10 and 11, aged 14-16yrs) and take GCSE exams at the end
5
6 of Year 11. The oldest ALSPAC children sat their GCSE exams in 2007, the youngest in
7
8 2009. Our main outcomes were two measures of attainment. First, a binary measure:
9
10 achievement of 5+ good GCSEs (grades A*-C, including English and Maths). Second, a
11
12 continuous measure: capped point score, expressed as a percentage of the maximum possible
13
14 capped point score (based on the eight best grades obtained, with each grade assigned a
15
16 numerical value)(26). Secondary educational outcomes included: persistent absence ($\geq 10\%$
17
18 of half days); special educational needs (SEN) status (see Supplementary Text for definitions
19
20 of the different SEN categories); and school mobility (whether child joined school during
21
22 KS4).
23
24
25
26
27
28

29 *Contact with children's social care services*

30
31
32 Contact with children's social care services (referred to as 'social care status' hereafter) was
33
34 summarised in two variables. The first specified whether a child had any post-2005 CLA
35
36 record(s) or post-2008 CIN record(s) (i.e. was looked-after or referred to social care services
37
38 at any time for which we have linked social care data). The second summarised social care
39
40 status during KS4 only. This restriction was necessary for the educational outcomes analyses
41
42 to ensure our exposure preceded our outcome, plus these are the only two school years with
43
44 CLA data coverage for all children in our sample (Supplementary Table A). By definition
45
46 children who are looked-after are also in need but we use 'in need' to refer to children with a
47
48 CIN but not a CLA record. The reference group comprised children with a KS4 record in the
49
50 NPD who had no linked social care record.
51
52
53

54
55 Variables related to being in care or in need were derived from the linked data as follows.

56
57 CIN Census: category of need; age referred. CLA Return: category of need; age first period of
58
59
60

1
2
3 care (POC) started (POC is a period of time when child is continuously looked-after by the
4 local authority); number of POC and episodes of care (a POC is comprised of ‘episodes’, each
5 representing a period of being looked-after under the same legal status and in the same
6 placement); placement type (foster; children’s home/residential home/residential school; other
7 [no further disaggregation possible due to small numbers]).
8
9
10
11
12
13

14 15 *Covariates*

16
17
18 These included child age and sex, plus measures related to family socio-economic position
19 (SEP). Early-life exposures included maternal age at delivery, and measures reported by the
20 mother during pregnancy: highest educational qualification; financial difficulties; housing
21 tenure; partner status; smoking; alcohol intake; social support; and depressive symptoms(27).
22
23 Later measures of SEP (during KS4) were obtained from the NPD: receipt of free school
24 meals (FSM)(28); and child’s residential neighbourhood deprivation measured by the Income
25 Deprivation Affecting Children Index (IDACI)(29). More details in Supplementary Text.
26
27
28
29
30
31
32
33
34

35 **Statistical analyses**

36
37
38 Descriptive statistics were used to: summarise the social care data linked to ALSPAC
39 children; compare the ALSPAC looked-after sample to the two non-ALSPAC looked-after
40 comparison groups; compare child, maternal and SEP characteristics by social care status;
41 describe questionnaire completion rates by social care status.
42
43
44
45
46
47

48 Associations between social care status and educational outcomes were examined using
49 multilevel regression models (individual level 1, school level 2). Linear models were used for
50 capped point score, logistic for attainment of 5+ good GCSEs. Associations were adjusted for
51 age and sex (Model 1), then also for KS4 measures [FSM, neighbourhood deprivation, school
52 mobility] (Model 2), or for early-life exposures (Model 3). We then adjusted for all KS4 and
53 early-life variables (Model 4). Multiple imputation using chained equations was used to
54
55
56
57
58
59
60

1
2
3 impute missing data (supplementary Table B) for the educational outcomes analyses sample
4
5 (n=9545). 100 datasets were imputed.
6
7

8 In sensitivity analyses, models were restricted to children with no SEN (n=8145) or no
9
10 disability (n=9506). Social care status at any time was also considered. Finally, we described
11
12 associations between social care characteristics (e.g. placement type, reason for being in need)
13
14 and capped point score in those with CIN or CLA records: to maximise sample size, we
15
16 included all those who had these records at any time and who had capped point score data.
17
18
19

20 **Patient and Public Involvement**

21
22
23 Patients, the public, and study participants were not directly involved in this study. Some
24
25 ALSPAC participants are members of a committee which meets bi-monthly to provide
26
27 insights and advice on general ALSPAC study design, methodology and acceptability for
28
29 participants.
30
31
32
33
34
35

36 **RESULTS**

37 **Children in ALSPAC with social care records**

38
39
40 Of those with a post-2008 CIN (but no CLA) record (n=209) the most common needs at
41
42 referral were child disability, abuse or neglect, and family in acute stress. Of those with a
43
44 post-2005 CLA record (n=137), the most common primary need was abuse or neglect
45
46 (Supplementary Tables C and D). Median total time in care was 2.6 years. Foster care was
47
48 the most common placement type.
49
50
51
52
53

54 **Comparison to non-ALSPAC looked-after children**

55
56
57 The ALSPAC children with CLA records were generally similar to those of children born at
58
59 the same time who were ever in care in England (comparison group 1) or in the area in and
60

1
2
3 around Bristol (comparison group 2) in terms of primary need (Supplementary Table E).
4
5 Importantly, many of those who had ever had a CLA record in the two comparison groups
6
7 (36% of group 1; 42% of group 2) had left care before the age of 12 (the youngest age at
8
9 which we were able to link CLA records to ALSPAC).
10
11
12

13 **Availability of cohort data**

14
15
16 Maternal questionnaire response rates were highest for participants with no social care record
17
18 and lowest for those with a CLA record at all time points. Differences generally widened
19
20 over time (Figure 2). Patterns were similar for partner and child, but not teacher,
21
22 questionnaires (supplementary Figures 1a-d).
23
24
25

26 **Educational outcomes at 16 years**

27
28
29 Of the 9545 children in these analyses, 49 had CLA and 64 CIN (no CLA) records during
30
31 KS4. These groups were more disadvantaged than their peers in early-life and during KS4
32
33 (Table 1). They were more likely to have joined their school recently.
34
35

36
37 Of those with CIN or CLA records, <15% passed 5+ good GCSEs compared to >50% of their
38
39 peers. Mean percentage scores were also markedly lower (Table 2). They were more likely
40
41 to have SEN and persistent absence rates were higher, particularly for the in need group.
42

43
44 Adjustment for school absence, neighbourhood deprivation, and receipt of FSM attenuated
45
46 associations slightly for the CIN group but had less of an impact for the CLA group (Table 3).
47

48
49 Adjustment for early-life maternal and SEP factors had more of an attenuating effect for the
50
51 CLA than the CIN group. Attainment differences between these groups and their peers
52
53 remained in the fully adjusted model.
54

55
56 In sensitivity analyses, when social care records at any time were considered, patterns were
57
58 similar for the CLA group (n=76), while the CIN group (n=148) tended to do better than
59
60 when restricted to only those who were in need during KS4 (Table 2). When the sample

1
2
3 excluded those with SEN or disability, results were similar to those of the main analyses
4
5 (supplementary tables F and G).
6
7

8 Estimates of the relationship between social care characteristics and attainment were
9
10 imprecise due to small numbers. Those in foster placements had higher capped percentage
11
12 scores (mean 37.0, 95% CI 30.7 to 43.2, n=64) than those in children's/residential
13
14 homes/residential schools (28.3, 14.7 to 42.0, n=12). With regards need status, 'child
15
16 disability' was associated with the lowest attainment for the CIN group and 'socially
17
18 unacceptable behaviour' for the CLA group. For both CLA and CIN groups, those in the
19
20 'parental illness/disability' category had the highest attainment. However confidence
21
22 intervals were wide and overlapping.

Table 1: Summary of maternal, family and child characteristics, by social care status of child during Key Stage 4

		Child's social care status during KS4		
		No CLA/CIN record n=9432	CIN (no CLA) record n=64	CLA record n=49
Maternal and family characteristics during pregnancy¹		% (95% CI)		
Maternal age (at delivery)	<=23 years	18.4 (17.7-19.2)	39.1 (27.0-51.4)	28.6 (15.4-41.7)
	>33 years	12.3 (11.6-12.9)	7.8 (1.1-14.6)	14.3 (4.1-24.5)
Relationship status	Married	75.0 (74.1-75.9)	53.8 (40.8-66.7)	49.5 (34.3-64.8)
	Resident partner	16.5 (15.7-17.3)	17.0 (6.9-27.1)	27.4 (13.5-41.3)
	Non-resident/no partner	8.5 (7.9-9.1)	29.2 (17.3-41.2)	23.1 (9.9-36.3)
Highest maternal education	A Level or degree	30.7 (29.8-31.7)	10.8 (2.3-19.3)	11.1 (0.9-21.4)
	O Level	36.5 (35.5-37.5)	40.7 (27.2-54.1)	26.3 (12.1-40.6)
	Vocational/none	32.8 (31.8-33.8)	48.5 (34.6-62.5)	62.5 (47.2-77.9)
Financial difficulties	Highest quartile	21.2 (20.3-22.1)	42.2 (27.6-56.8)	46.8 (30.4-63.2)
Housing tenure	Owned/mortgaged	73.7 (72.8-74.7)	54.3 (41.4-67.3)	33.7 (19.2-48.2)
Maternal smoking	Yes	26.6 (25.7-27.6)	41.3 (28.2-54.3)	58.6 (42.3-75.0)
Maternal alcohol - first trimester, ≥1 unit per week	Yes	15.2 (14.4-15.9)	17.8 (7.6-28.0)	21.7 (8.0-35.3)
Maternal alcohol - 2 nd trimester, ever ≥4 units in one day	Yes	16.9 (16.1-17.6)	26.7 (14.8-38.5)	21.1 (7.6-34.6)
Depression score	Highest quartile	23.4 (22.5-24.3)	29.4 (16.4-42.4)	47.8 (31.5-64.1)
Low social support	Yes	10.3 (9.6-11.0)	20.8 (8.7-32.8)	25.9 (10.6-41.2)
Child, school and neighbourhood characteristics during KS4¹		% or mean (95% CI)		
Sex	Female	49.6 (48.6-50.6)	51.6 (39.0-64.2)	49.0 (34.5-63.5)
Age at start of Year 11	Mean (years)	15.5 (15.4-15.5)	15.5 (15.4-15.6)	15.5 (15.4-15.5)
In receipt of free school meals	Yes	6.1 (5.6-6.6)	26.6 (15.4-37.7)	10.2 (1.4-19.0)
Joined school during KS4	Yes	1.4 (1.1-1.6)	7.8 (1.1-14.6)	12.2 (2.7-21.8)
Neighbourhood deprivation (IDACI)	Low, <10%	43.9 (42.9-44.9)	20.3 (10.2-30.4)	28.6 (15.4-41.7)
	High, ≥40%	10.1 (9.5-10.7)	25.0 (14.1-35.9)	20.4 (8.7-32.1)

¹ For brevity, not all categories are presented for each categorical variable.

Table 2: Educational attainment, persistent absence, and special educational needs by child social care status

	Social care status during KS4			Social care status any time		
	No CLA/CIN record n=9432	CIN (no CLA) record n=64	CLA record n=49	No CLA/CIN record n=9321	CIN (no CLA) record n=148	CLA record n=76
Educational Attainment	% or mean (95% CI)			% or mean (95% CI)		
5+ A*-C GCSEs including English & Maths	53.0 (52.0-54.0)	10.9 (3.1-18.8)	12.2 (2.7-21.8)	53.3 (52.3-54.4)	19.6 (13.1-26.1)	10.5 (3.5-17.6)
Capped percentage point score	68.9 (68.5-69.3)	37.4 (31.3-43.5)	34.9 (27.4-42.3)	69.1 (68.7-69.5)	47.7 (43.8-51.7)	33.9 (28.2-39.6)
Special Educational Needs (SEN) ¹						
School action	8.5 (7.9-9.1)	12.5 (4.2-20.8)	n<5	8.4 (7.8-9.0)	16.2 (10.2-22.2)	9.2 (2.6-15.9)
School action plus	3.1 (2.8-3.5)	15.6 (6.5-24.8)	24.5 (12.0-37.0)	3.1 (2.7-3.4)	8.1 (3.7-12.6)	21.1 (11.7-30.4)
Statement of Special Educational Needs	2.4 (2.1-2.7)	46.9 (34.3-59.4)	24.5 (12.0-37.0)	2.3 (2.0-2.6)	22.3 (15.5-29.1)	35.5 (24.5-46.5)
Persistent absence	6.8 (6.3-7.3)	32.8 (21.0-44.6)	18.4 (7.1-29.6)	6.7 (6.2-7.2)	19.6 (13.1-26.1)	21.1 (11.7-30.4)

¹For definitions of these SEN categories, please see Supplementary Text.

Table 3: Association between child social care status and educational outcomes, with adjustment for early-life and KS4 variables

Attainment Outcome	Care status during KS4	Model 1 ¹	Model 2 ²	Model 3 ³	Model 4 ⁴
		(Age and Sex) OR (95% CI)	(KS4 variables) OR (95% CI)	(Early-life variables) OR (95% CI)	(Fully adjusted) OR (95% CI)
5+ A*-C GCSEs including English & Maths	Not CIN or CLA	Ref	Ref	Ref	Ref
	CIN (not CLA)	0.11 (0.05-0.27)	0.17 (0.07-0.40)	0.15 (0.06 to 0.36)	0.19 (0.08-0.46)
	CLA	0.14 (0.05-0.35)	0.14 (0.06-0.36)	0.25 (0.10 to 0.63)	0.24 (0.09-0.63)
		Coeff (95% CI)	Coeff (95% CI)	Coeff (95% CI)	Coeff (95% CI)
Capped percentage point score	Not CIN or CLA	Ref	Ref	Ref	Ref
	CIN (not CLA)	-22.1 (-26.7 to -17.5)	-14.1 (-18.4 to -9.8)	-18.4 (-22.6 to -14.1)	-13.1 (-17.1 to -9.0)
	CLA	-28.4 (-33.5 to -23.3)	-25.0 (-29.7 to -20.3)	-21.9 (-26.6 to -17.2)	-20.6 (-25.0 to -16.1)

¹Adjusted for child age and sex

²Adjusted for child age and sex, plus KS4 time-point variables (persistent school absence, in receipt of free school meals, school mobility, IDACI of residential neighbourhood)

³Adjusted for child age and sex, plus early-life [maternal and SEP] variables (maternal age at delivery, education, partner status, housing tenure, financial difficulties, smoking, alcohol, depression, social support)

⁴Adjusted for child age and sex, plus KS4 and early life variables

DISCUSSION

Children who were looked-after or in need during KS4 had low attainment at age 16. The early-life exposures we considered were not a major explanatory factor. We believe this is the first time linkage to the CLA Return and CIN Census has been used to identify birth cohort participants who were looked-after or in need during adolescence. As linkage data were also used for outcome measures, participants could be included even if their families no longer actively participated in the cohort study. Record linkage therefore allowed vulnerable children to not only be included in research but to be the focus of it. However, the identification and inclusion of in need and looked-after children in research using record linkage does have challenges.

For cohort studies in England with relevant permissions, linkage to the CLA Return and CIN Census via the NPD offers a convenient means of identifying participants who have been in need or looked-after. For cohorts younger than ALSPAC, this method would allow identification of social care records that cover most, if not all, of participants' childhoods. However, in ALSPAC we were only able to link to records covering a period during adolescence. Consequently, outcomes at younger ages cannot be examined by social care status in ALSPAC using this method. Of the looked-after children in England the same age as the ALSPAC participants, we found around 40% had left the care system by the age of 12. Consequently, our reference group likely includes children who were looked-after or in need at younger ages only.

Examination of questionnaire response rates showed the value of using linked outcome data to increase the inclusion of vulnerable children in research: there was little questionnaire data available beyond infancy for participants with social care records in adolescence. In this current study, we examined educational outcomes at age 16, obtained from the NPD. The

1
2
3 association between social care status and other later outcomes available from linked data
4
5 could also be investigated using ALSPAC, such as mental illness or entry into higher
6
7 education.
8
9

10
11 ALSPAC participants with CLA and CIN records in adolescence had lower educational
12
13 attainment than their peers in the reference group. In the most recent national data available,
14
15 attainment patterns by social care status broadly reflect these findings(1). We found
16
17 persistent absence rates to be considerably lower for those looked-after than those in need
18
19 during KS4. Similarly, in the national data (on pupils of all ages) 9% of looked-after children
20
21 were persistent absentees and 28% of children in need(1). Therefore, although our
22
23 participants were in KS4 around 10 years ago and the number with social care records small,
24
25 the patterning of educational characteristics by care status is broadly similar to the present-
26
27 day situation.
28
29

30
31
32 Using both ALSPAC questionnaire data and measures from the NPD, we found a persistence
33
34 of disadvantage from early-life to adolescence for participants with CIN and CLA records.
35
36 Social disadvantage is known to be strongly associated with poorer educational
37
38 attainment(30, 31), and our SEP measures were strongly related to the educational outcomes.
39
40 Adjustment for them attenuated associations slightly but the low attainment of the CLA and
41
42 CIN groups remained. We are not considering the SEP measures as confounders but rather
43
44 part of the complex causal pathway from early-life adversity through to poor educational
45
46 attainment. It is notable that many of the mothers of the children with social care records had
47
48 very low educational attainment themselves.
49
50
51

52
53 Alcohol and tobacco, the most commonly used substances in pregnancy, can cross the
54
55 placenta and alter normal brain development (32). In our sample, those with social care
56
57 records had higher levels of exposure to these substances than their peers. Those with CIN
58
59
60

1
2
3 records were the most likely to have ever been exposed to ≥ 4 units of alcohol in one day.

4
5 Exposure to this level of alcohol has previously been found to be negatively associated with
6
7 educational attainment in the ALSPAC sample (33, 34). However, in our analyses,
8
9 adjustment for maternal alcohol use did not alter the associations observed between social
10
11 care status and educational attainment. This may be due in part to our binary alcohol
12
13 measures (necessary due to small numbers) failing to accurately capture exposure, and not
14
15 identifying those at highest risk. This is an important limitation as many children in the care
16
17 system have foetal alcohol syndrome, a condition which is often undiagnosed and is the most
18
19 common, non-genetic cause of learning disability in the UK (35, 36). The majority of
20
21 participants with CLA records had a mother who smoked during pregnancy, and this
22
23 exposure was negatively associated with attainment. However there is debate as to whether
24
25 maternal smoking during pregnancy is a direct cause of poorer child educational attainment,
26
27 or is instead a strong marker of socio-economic disadvantage (37-39).
28
29
30
31
32

33
34 Overall, little of the poor educational outcomes in the looked-after and in need groups
35
36 appeared to be explained by the early-life exposures we considered. This could suggest there
37
38 is scope for later experiences, including social care, to improve outcomes. However, other
39
40 early-life exposures, or genetic factors, that we have not considered could be of importance.
41
42

43
44 While aspects of care itself could be important contributors to educational outcomes,
45
46 ascertaining direction of causality in the relationship between child behaviours, care
47
48 characteristics, and educational outcomes is difficult. As expected, we found children in
49
50 foster care had higher attainment than those not in family-based care: the latter children are
51
52 likely to be those whose foster placements have broken down, reflecting complex additional
53
54 needs and challenging behaviours. Further, foster carers may have greater commitment and
55
56 longer-term interest in the child than group care staff(40). We were unable to consider
57
58 placement stability, which has previously been shown to be beneficial(41). However, in
59
60

1
2
3 concordance with previous studies, school mobility was associated with lower attainment(42,
4 43) and children with CLA or CIN records were much more likely to have changed school
5 during KS4 than their peers.
6
7
8
9

10 The relatively high proportion of looked-after and in need children with SEN or disability did
11 not appear to explain the low average attainment of these groups. Similarly, in the national
12 data looked-after children with no identified SEN made less educational progress than non-
13 looked-after children(1). It is important to note that the attainment gap between looked-after
14 and in need children and their peers is apparent from a young age, often before the child
15 enters care(1, 41). Being looked-after may not be the principal cause of poor attainment,
16 rather it is a marker of extreme childhood adversity, which is itself associated with poor
17 outcomes. Being in care is often beneficial for a child's education(17, 18, 41).
18
19
20
21
22
23
24
25
26
27
28
29

30 Strengths of this study include the use of a novel method to identify vulnerable adolescents in
31 a population-based cohort, and objective outcome measures. Limitations include incomplete
32 ascertainment of social care record status, little cohort data beyond early childhood for those
33 with social care records, and small numbers. Children who experience the most
34 disadvantaged starts in life are likely under-represented in ALSPAC as their mothers would
35 have been least likely to attend antenatal appointments, which is where many mothers were
36 recruited to the study.

47 **Conclusions**

48
49 Data linkage provides a means of identifying children with social services contact in cohort
50 studies and of increasing their inclusion in research. The poor educational outcomes of the
51 ALSPAC adolescents with social care records did not appear to be substantially explained by
52 the early-life exposures we considered. Further research, ideally with social care data across
53 the lifecourse, would help identify which factors are important in explaining the poor

educational attainment of these vulnerable children, and would help inform the development of effective interventions.

For peer review only

Acknowledgments

We are extremely grateful to all the families who took part in this study, the midwives for their help in recruiting them, and the whole ALSPAC team, which includes interviewers, computer and laboratory technicians, clerical workers, research scientists, volunteers, managers, receptionists and nurses.

Conflicts of interest

JM is a foster carer. AT, AB and DW have no conflicts of interest to declare.

Funding

Core support for ALSPAC is provided by the UK Medical Research Council and Wellcome (Grant reference: 102215/2/13/2) and the University of Bristol. The Wellcome Trust (WT086118) funded ALSPACs linkage infrastructure through the Project to Enhance ALSPAC through Record Linkage (PEARL). This work was supported by the Elizabeth Blackwell Institute for Health Research, University of Bristol and the Wellcome Trust Institutional Strategic Support Fund (Grant number: 105612/Z/14/Z).

Contributor Statement

JM and AB conceived the study, and AT and JM developed the research question. AT conducted the analyses, interpreted the data and drafted the manuscript. JM and DW helped interpret the data and critically revised the paper. AB critically revised the paper.

Data Sharing Statement

The ALSPAC data management plan (available here: <http://www.bristol.ac.uk/alspac/researchers/data-access/documents/alspac-datamanagement-plan.pdf>) describes in detail the policy regarding data sharing, which is through a system of managed open access.

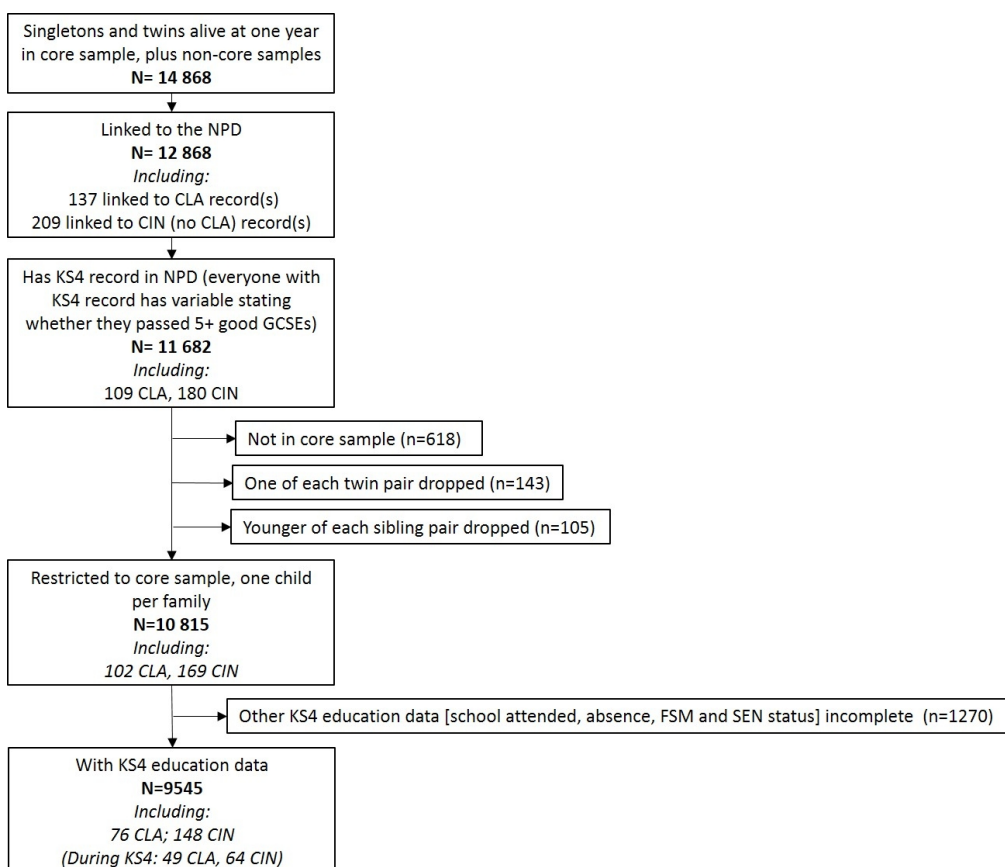

Figure 1 - Flow Chart of Sample
218x189mm (150 x 150 DPI)

Notes on figure:

Sample restricted to mothers in the core sample, whose child has been linked to the National Pupil Database.

Mothers may not have completed every question within each questionnaire.

Figure 2 - Maternal questionnaire response rates by child social care status

231x223mm (150 x 150 DPI)

Supplementary (online only) Tables

Table A: Summary of CLA and CIN data availability by year and period of birth

Table B: Summary of early-life (maternal and family) variables before and after multiple imputation

Table C: Summary of CIN data for ALSPAC participants linked to a post-2008 CLA record

Table D: Summary of care data for ALSPAC participants linked to a post-2005 CLA record

Table E: Comparison of care characteristics between ALSPAC CLA participants and CLA individuals in general population (in ALSPAC area and in England) of same age.

Table F: Educational attainment, absence, and special educational needs by care status – no SEN

Table G: Educational attainment, absence, and special educational needs by care status – no disability

Table A: Summary of CLA and CIN data availability by year and period of birth

Period of birth	Expected school year in March of each year ¹					
	2006 ²	2007 ²	2008 ²	2009 ^{2,3}	2010 ^{2,3}	2011 ^{2,3}
April 1991 to August 1991	Year 10	Year 11⁴	Year 12	Year 13		
September 1991 to August 1992	Year 9	Year 10	Year 11⁴	Year 12	Year 13	
September 1992 to January 1993	Year 8	Year 9	Year 10	Year 11⁴	Year 12	Year 13

¹ The school year in England runs from September to July. In contrast, the CLA and CIN data collection year runs from April to March. For example, the 2006 CLA dataset would cover the period from April 2005 to March 2006; the oldest ALSPAC participants would have been in Year 10 in March 2006, and the youngest in Year 8.

² CLA data linked to NPD available

³ CIN data linked to NPD available

⁴ GCSE exams are taken in May/June of Year 11.

Determining who had CIN record during KS4:

For the CIN data, the youngest cohort participants were in Year 11 at the time of the earliest CIN data collection and they were coded as being 'in need during KS4' if they had a CIN record. However, the majority of the cohort were already in Year 12 or 13 at this time, and so we calculated the age they had been referred, and identified those who had been referred before they sat their KS4 exams (age on the 1st June of the year they were in Year 11 was used as a proxy for age that exams were taken).

Table B: Summary of early-life (maternal and family) variables before and after multiple imputation

Variables with missing data in study sample ¹	% missing	Categories ²	Study sample [N=9545]	
			Before imputation [N specified for each variable individually]	Imputed [N=9545]
Variables reported by mother during pregnancy				
Relationship status	5.2		N=9048	
		Married (%)	75.7 (74.8-76.6)	74.7 (73.8-75.6)
		Resident partner (%)	16.1 (15.3-16.8)	16.5 (15.8-17.3)
		Non-resident/no partner (%)	8.2 (7.7-8.8)	8.7 (8.1-9.3)
Highest maternal education	9.7		N=8623	
		A Level or degree (%)	31.7 (30.8-32.7)	30.5 (29.5-31.4)
		O Level	36.8 (35.8-37.9)	36.5 (35.5-37.5)
		Vocational/none (%)	31.4 (30.4-32.4)	33.0 (32.0-34.0)
Financial difficulties	12.1		N=8387

Housing tenure	5.7		N=9003	
		Owned/mortgaged (%)	74.6 (73.6-75.4)	73.4 (72.5-74.3)
Maternal smoking	5.0		N=9068	
		Yes (%)	26.2 (25.3-27.1)	26.9 (26.0-27.8)
Depression score	13.1		N=8294	
		Highest quartile (%)	22.7 (21.8-23.6)	23.5 (22.6-24.5)
Frequency of alcohol drinking in first trimester	6.0		N=8975	
		Never or <1 unit/week	84.8 (84.1-85.6)	84.8 (84.1-85.5)
		1-6 units or 7+ units/week	15.2 (14.4-15.9)	15.2 (14.5-15.9)
Any days drinking ≥4 units alcohol during second trimester	6.2		N=8950	
		Yes	16.8 (16.0-17.5)	16.9 (16.2-17.7)
Low social support	16.8		N=7942	
		Yes (%)	9.3 (8.7-10.0)	10.5 (9.8-11.2)
Educational attainment from NPD				
Capped percentage point score ³	0.9	Mean	68.8 (68.4-69.2)	68.5 (68.1-68.9)

¹ The following variables had no missing data in study sample: child age, sex, maternal age at delivery, attainment of 5+ good GCSEs, persistent absence, SEN status, school attended.

² For brevity, not all categories are presented for each variable.

³ The binary attainment variable (5+ good GCSEs) was complete for all those with a KS4 NPD record, but a small number (n=82) had missing capped point score data.

Table C: Summary of CIN data for ALSPAC participants linked to a post-2008 CIN record (but no CLA record)

Variable		CIN (no CLA) record N=209
Age (yrs) at referral date	Median (range)	16.7 (2.5-18.1)
Primary need status	Abuse or neglect (% , 95% CI)	22.0 (16.9-28.2)
	Child disability/illness (% , 95% CI)	23.4 (18.2-29.7)
	Parental illness/disability (% , 95% CI)	[n<5]
	Family in acute stress (% , 95% CI)	21.5 (16.4-27.7)
	Family dysfunction (% , 95% CI)	18.2 (13.5-24.1)
	Socially unacceptable behaviour (% , 95% CI)	[n<5]
	Low income (% , 95% CI)	[n<5]
	Absent parenting (% , 95% CI)	[n<5]
	Cases other than CIN (% , 95% CI)	[n<5]
	Not stated (% , 95% CI)	10.0 (6.6-15.0)
Child ever coded as having disability	Yes (% , 95% CI)	22.0 (16.9-28.2)

Table D: Summary of care data for ALSPAC participants linked to a post-2005 CLA record

Variable		Linked to CLA record		
		Overall n=137	Eligible for one-third sample ¹ n=47	Ineligible for one- third sample ² n=90
Total number of periods of care ³	Median, range	1 (1-13)	1 (1-8)	1 (1-13)
Total number of episodes of care ³	Median, range	3 (1-28)	3 (1-24)	3 (1-28)
Age (yrs) at start of first period of care ³	Median, range	13.2 (0-17.8)	11.5 (0-17.6)	13.7 (0.1-17.8)
Age (yrs) at end of last episode of care ³	Median, range	17.7 (13.1-18.0)	18.0 (13.1-18.0)	17.1 (13.2-18.0)
		N=134	N=45	N=89
Total duration (days) in care ^{3,4}	Median, range	906 (1-5736)	1394 (2-5498)	604 (1-5736)

	Socially unacceptable behaviour (%; 95% CI) ⁶	8.8 (5.0-14.9)	/	/
	Absent parenting (%; 95% CI) ⁶	4.4 (2.0-9.5)	/	/
Placement type for last episode of care	Foster care (%; 95% CI)	62.8 (54.3-70.5)	57.4 (42.6-71.1)	65.6 (55.0-74.8)
	Children's/residential/care home or school (%; 95% CI)	18.2 (12.6-25.7)	23.4 (13.2-38.1)	15.6 (9.3-24.8)
	Other (%; 95% CI)	19.0 (13.2-26.5)	19.1 (10.0-33.5)	18.9 (12.0-28.5)
Reason for last episode of care ending	Returned home to parents or relatives (%; 95% CI)	36.5 (28.8-45.0)	27.7 (16.5-42.6)	41.1 (31.3-51.7)
	Moved to independent living (%; 95% CI)	16.8 (11.4-24.1)	19.1 (10.0-33.4)	15.6 (9.3-24.8)
	Residential care funded by adult social services (%; 95% CI)	13.1 (8.3-20.0)	21.3 (11.6-35.8)	8.9 (4.4-17.0)
	Other (%; 95% CI)	32.8 (25.4-41.2)	31.9 (19.9-47.0)	34.4 (25.2-45.0)

¹Individuals eligible for the one-third sample will have CLA records in the period 1998-2003 if they were looked-after during this time.

²No CLA data were collected from 2008-2003 for those ineligible for the one-third sample; therefore their looked-after status during this period is unknown.

³Measures relate to the data available from linkage only: these should be complete for those eligible for the one-third sample, but will not be for those in the ineligible sample who were looked-after during 1998-2003.

⁴The sum of the duration of all episodes of care, which may or may not have been consecutive.

⁵Refers to primary need at the start of the first period of care for which we have a record.

⁶Percentages not shown by one-third sample status for these need categories to prevent derivation of small cell counts (n<5).

Table E: Comparison of care characteristics between ALSPAC participants with CLA records and individuals with CLA records in general population of same age (in ALSPAC area and in England).

		Born 1991 or 1992 with CLA record in England ¹	Born 1991 or 1992 with CLA record in ALSPAC area ^{1,2}	ALSPAC participants with CLA record

— No CLA or CIN record
 - - - CIN (no CLA) record
 — CLA record

Early-life adversity, contact with children's social care services, and educational outcomes at age 16 years

Teyhan, Boyd, Wijedasa and Macleod

Supplementary Text - Additional details on some variables

- **Special Educational Needs (SEN)**

School Action (SA) - used when there is evidence that a child is not making progress at school and there is a need for action to be taken to meet learning difficulties. This can include involvement of extra teachers, use of different learning materials, special equipment or a different teaching strategy.

School Action Plus (SA+) - used where SA has not been able to help the child make adequate progress. The school has sought external services from the local education authority (LEA), the local health authority, or social services to help the child make adequate progress (e.g. speech and language therapist, educational psychologist etc.).

Statement of SEN - if the additional help provided by SA+ is not enough then the child's school or parents can apply to the LEA for a Statutory Assessment of the child's SEN in order to try and obtain a statement of SEN. The 'statement' is a document which sets out a child's SEN and any additional help that the child should receive. A Statement is normally made when all the educational provision required to meet a child's needs cannot reasonably be met by the resources within a child's school at SA+.

- **Early-life, maternal and family characteristics**

The following maternal, family and socioeconomic measures were reported by the mothers during their pregnancy with the study child via postal questionnaires. The categories for each variable are given in parenthesis following the variable name.

Highest educational qualification (university degree/A level; O level; vocational/none)

Early-life adversity, contact with children's social care services, and educational outcomes at age 16 years

Teyhan, Boyd, Wijedasa and Macleod

Financial Difficulties (quartiles of score with range 0–40, where 0 is no financial difficulties)

Housing tenure (owned/mortgaged; private rent; council rent; other)

Partner status (husband; live with partner; do not live with partner/no partner)

Smoking during pregnancy (no; yes)

Low social support - measured by response to 10 items with a low score defined as being in the bottom 10% (no; yes).

Maternal depression - measured by the Edinburgh Postnatal Depression Scale. Although this measure was originally designed for use with postnatal women, none of the 10 items is specific to this period and it has been validated for use at other times; it was chosen as it does not contain somatic items that could confound normal symptoms in pregnancy with depression (27). Quartiles were derived.

- **Proxy measures of socio-economic position when child aged 16**

The following measures were obtained from the National Pupil Database.

Child in receipt of free school meals (FSM) - eligibility is based on low parental income (28) (no; yes)

Child's residential neighbourhood deprivation - measured by the Income Deprivation Affecting Children Index (IDACI) (29), which gives the proportion of children (<0-15yrs) in a neighbourhood (lower super output area, average population 1500) who live in a low income family (<10%; 10 to <20%; 20 to <30%; 40%+).

STROBE Statement—checklist of items that should be included in reports of observational studies

	Item No	Recommendation	Page No
Title and abstract	1	(a) Indicate the study's design with a commonly used term in the title or the abstract	1,2
		(b) Provide in the abstract an informative and balanced summary of what was done and what was found	2
Introduction			
Background/rationale	2	Explain the scientific background and rationale for the investigation being reported	4-5
Objectives	3	State specific objectives, including any prespecified hypotheses	5
Methods			
Study design	4	Present key elements of study design early in the paper	5-6
Setting	5	Describe the setting, locations, and relevant dates, including periods of recruitment, exposure, follow-up, and data collection	5-6
Participants	6	(a) <i>Cohort study</i> —Give the eligibility criteria, and the sources and methods of selection of participants. Describe methods of follow-up <i>Case-control study</i> —Give the eligibility criteria, and the sources and methods of case ascertainment and control selection. Give the rationale for the choice of cases and controls <i>Cross-sectional study</i> —Give the eligibility criteria, and the sources and methods of selection of participants	5
		(b) <i>Cohort study</i> —For matched studies, give matching criteria and number of exposed and unexposed <i>Case-control study</i> —For matched studies, give matching criteria and the number of controls per case	N/A
Variables	7	Clearly define all outcomes, exposures, predictors, potential confounders, and effect modifiers. Give diagnostic criteria, if applicable	6-8
Data sources/ measurement	8*	For each variable of interest, give sources of data and details of methods of assessment (measurement). Describe comparability of assessment methods if there is more than one group	5-8
Bias	9	Describe any efforts to address potential sources of bias	6,8,9
Study size	10	Explain how the study size was arrived at	5
Quantitative variables	11	Explain how quantitative variables were handled in the analyses. If applicable, describe which groupings were chosen and why	6-8
Statistical methods	12	(a) Describe all statistical methods, including those used to control for confounding	8-9
		(b) Describe any methods used to examine subgroups and interactions	N/A
	(c) Explain how missing data were addressed	8	
	(d) <i>Cohort study</i> —If applicable, explain how loss to follow-up was addressed <i>Case-control study</i> —If applicable, explain how matching of cases and controls was addressed <i>Cross-sectional study</i> —If applicable, describe analytical methods taking account of sampling strategy	N/A	
	(e) Describe any sensitivity analyses	9

Results			
Participants	13*	(a) Report numbers of individuals at each stage of study—eg numbers potentially eligible, examined for eligibility, confirmed eligible, included in the study, completing follow-up, and analysed	Fig 1
		(b) Give reasons for non-participation at each stage	Fig 1
		(c) Consider use of a flow diagram	Fig 1
Descriptive data	14*	(a) Give characteristics of study participants (eg demographic, clinical, social) and information on exposures and potential confounders	Table 1
		(b) Indicate number of participants with missing data for each variable of interest	Table A
		(c) <i>Cohort study</i> —Summarise follow-up time (eg, average and total amount)	N/A
Outcome data	15*	<i>Cohort study</i> —Report numbers of outcome events or summary measures over time	Table 2
		<i>Case-control study</i> —Report numbers in each exposure category, or summary measures of exposure	N/A
		<i>Cross-sectional study</i> —Report numbers of outcome events or summary measures	N/A
Main results	16	(a) Give unadjusted estimates and, if applicable, confounder-adjusted estimates and their precision (eg, 95% confidence interval). Make clear which confounders were adjusted for and why they were included	Table 2
		(b) Report category boundaries when continuous variables were categorized	N/A
		(c) If relevant, consider translating estimates of relative risk into absolute risk for a meaningful time period	N/A
Other analyses	17	Report other analyses done—eg analyses of subgroups and interactions, and sensitivity analyses	10
Discussion			
Key results	18	Summarise key results with reference to study objectives	15
Limitations	19	Discuss limitations of the study, taking into account sources of potential bias or imprecision. Discuss both direction and magnitude of any potential bias	15,17
Interpretation	20	Give a cautious overall interpretation of results considering objectives, limitations, multiplicity of analyses, results from similar studies, and other relevant evidence	17,18
Generalisability	21	Discuss the generalisability (external validity) of the study results	16
Other information			
Funding	22	Give the source of funding and the role of the funders for the present study and, if applicable, for the original study on which the present article is based	19

*Give information separately for cases and controls in case-control studies and, if applicable, for exposed and unexposed groups in cohort and cross-sectional studies.

Note: An Explanation and Elaboration article discusses each checklist item and gives methodological background and published examples of transparent reporting. The STROBE checklist is best used in conjunction with this article (freely available on the Web sites of PLoS Medicine at <http://www.plosmedicine.org/>, Annals of Internal Medicine at <http://www.annals.org/>, and Epidemiology at <http://www.epidem.com/>). Information on the STROBE Initiative is available at www.strobe-statement.org.
